## NOVEL SCREENING METHOD

## 5 TECHNICAL FIELD

The present invention relates to use of a G protein-coupled receptor protein (GPR39).

## BACKGROUND ART

10 Physiological active substances such as various hormones, neurotransmitters, etc. regulate the biological function via specific receptor proteins present on cell membranes. Many of these receptor proteins are coupled with guanine nucleotide-binding protein (hereinafter sometimes simply referred to as G protein) and mediate the intracellular signal transduction via activation of G protein. These  
15 receptor proteins possess the common structure containing seven transmembrane domains and are thus collectively referred to as G protein-coupled receptor proteins (GPCR) or seven-transmembrane receptor proteins (7TMR).

G protein-coupled receptor proteins are present on the cell surface of each functional cell and organ in the body, and play a vitally important physiological role  
20 as the target of the molecules that regulate the functions of the cells and organs, e.g., physiologically active substances such as peptide hormones, nucleic acids, amines, lipids, etc. Receptor proteins transmit signals into cells via binding with physiologically active substances, and the signals induce various reactions such as activation and inhibition of the cells.

25 To clarify the relationship between substances that regulate complex biological functions in various cells and organs in the body, and their specific receptor proteins, in particular, G protein-coupled receptor proteins will elucidate the functional mechanisms in various cells and organs in the body to provide a very important means for development of drugs closely associated with these functions.

30 For example, in various organs, their physiological functions are controlled in vivo through regulation by many hormones, hormone-like substances, neurotransmitters or physiologically active substances. In particular, physiologically active substances are found in numerous sites of the body and regulate the physiological functions through their corresponding receptor proteins. Many  
35 unknown hormones, neurotransmitters or other physiologically active substances still

exist in the body and, as to their receptor proteins, many of these proteins have not yet been reported. In addition, a lot remains yet to be established if there are subtypes of known receptor proteins or if there are differences depending on species.

It is very important for development of drugs to clarify the relationship between substances that regulate elaborated functions in vivo and their specific receptor proteins. Furthermore, for efficient screening of agonists for and antagonists to receptor proteins in development of drugs, it is required to clarify functional mechanisms of receptor protein genes expressed in vivo and express the genes in an appropriate expression system.

In recent years, random analysis of cDNA sequences has been actively studied as a means for analyzing genes expressed in vivo. The sequences of cDNA fragments thus obtained have been registered on and published to databases as Expressed Sequence Tag (EST). Also, it has been extensively attempted to predict unknown genes from the analysis of genome sequences. However, since many ESTs or genome sequences contain sequence information only, it is difficult to predict their functions.

The amino acid sequence of human-derived GPR39 and the DNA encoding the same are reported (Genomics 1997, Dec 15;46(3):426-34, WO2002/61087, US2002/004491, WO2002/39885, WO2002/71928, WO2001/81634, WO2002/79492, WO2002/86443). However, functions of these G protein-coupled receptor proteins and their physiological ligands remain unresolved.

Heretofore, substances that inhibit the binding of G protein-coupled receptor proteins to physiologically active substances (i.e., ligands) or substances that bind and induce signals similar to those physiologically active substances (i.e., ligands) have been utilized for pharmaceuticals as antagonists or agonists specific to these receptor proteins that regulate the biological functions. Therefore, it is a very important means in search for agonists and antagonists that can be targeted for pharmaceutical development to determine specific ligands for G protein-coupled receptor proteins.

However, many G protein-coupled receptor proteins with unknown functions and many so-called orphan receptor proteins in which the corresponding ligands are yet unidentified are present even at this point of time. Thus, search of ligands for G protein-coupled receptor proteins and elucidation of their functions are eagerly awaited.

G protein-coupled receptor proteins are useful in search for a novel

physiological active substance (i.e., ligand) using the signal transduction activity as an indicator and in search for agonists and antagonists to the receptor protein. On the other hand, even though no physiological ligand is found, agonists and antagonists to the receptor protein may be prepared by analyzing the physiological action of the receptor protein through inactivation experiment of the receptor protein (knockout animal). Ligands, agonists or antagonists, etc. of these receptor proteins are expected to be utilized as preventive/therapeutic agents or diagnostic agents for diseases associated with dysfunction or hyperfunction of the G protein-coupled receptor proteins.

Furthermore, the decreased or increased functions of G protein-coupled receptor proteins due to genetic aberration of the G protein-coupled receptor proteins in the body often cause some disorders. In this case, the G protein coupled receptor proteins may be used not only for administration of antagonists or agonists for the receptor proteins, but also for gene therapy by introducing the receptor protein gene into the body (or some particular organs) or by introducing the antisense nucleic acid of the receptor protein gene. In this case, information on the base sequence of the receptor protein is essentially required for investigating deletion or mutation on the gene. The receptor protein gene is also applicable as preventive/therapeutic agents or diagnostic agents for diseases associated with dysfunction of the receptor protein.

The present invention relates to determination of ligands for orphan G protein-coupled receptor proteins with unknown functions and use of the G protein-coupled receptor proteins and their ligands. That is, the present invention aims at providing a method of screening a compound (an antagonist or agonist) or its salt that changes the binding property of the ligand to the G protein-coupled receptor protein; a kit for the screening; a compound (an antagonist or agonist) or its salt that changes the binding property of the ligand to the G protein-coupled receptor protein, which is obtainable by using the screening method or the screening kit; a pharmaceutical comprising a compound (an antagonist or agonist) or its salt that changes the binding property of the ligand to the G protein-coupled receptor protein or a compound that changes the expression level of the G protein-coupled receptor protein; and so on.

#### DISCLOSURE OF THE INVENTION

The present inventors made extensive investigations and as a result, found that ligands for human-derived GPR39 are particular metal elements or salts thereof.

Based on these findings, the inventors have continued further investigations and come to accomplish the present invention.

That is, the present invention provides the following features.

5 [1] A method of screening a compound or element or a salt thereof that changes the binding property or signal transduction of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, to an ionizable metal element or a salt thereof, which comprises using (1) said receptor protein, its partial peptide, or a salt thereof and (2) said metal element or a salt thereof.

10 [2] The screening method according to [1], wherein said G protein-coupled receptor protein is a G protein-coupled receptor protein consisting of the amino acid sequence represented by SEQ ID NO: 1, SEQ ID NO: 6 or SEQ ID NO: 8.

[3] A kit for screening a compound or element or a salt thereof that changes the binding property or signal transduction of a G protein-coupled receptor protein  
15 comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, to an ionizable metal element or a salt thereof, which comprises (1) said receptor protein, its partial peptide, or a salt thereof and (2) said metal element or a salt thereof.

[4] A compound or element or a salt thereof that changes the binding  
20 property or signal transduction of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, to an ionizable metal element or a salt thereof, which is obtainable by using the screening method according to [1] or the screening kit according to [3].

25 [5] A pharmaceutical, which comprises a compound or element or a salt thereof that changes the binding property or signal transduction of an ionizable metal element or a salt thereof to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof.

30 [6] A prophylactic/therapeutic agent for growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac  
35 disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or

menoxenia, which comprises an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof.

5 [7] A prophylactic/therapeutic agent for hypotonic bladder induced by sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, or an agent for promoting the secretion of cytokines (e.g., IL-8), which comprises an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof.

10 [8] A prophylactic/therapeutic agent for renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof.

15 [9] A prophylactic/therapeutic agent for overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus; an agent for suppressing the secretion of cytokines (e.g., IL-8); or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises an antagonist to a G protein-coupled receptor protein comprising the same or  
20 substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof.

[10] A method of screening an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which  
30 comprises assaying an intracellular  $\text{Ca}^{2+}$  level increasing activity when a test compound or element or a salt thereof is brought in contact with a cell containing said receptor protein.

[11] A method of screening an agonist for or an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same  
35 amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a

salt thereof, which comprises using (1) said receptor protein or its partial peptide, or a salt thereof and (2) a compound or element or a salt thereof that changes the binding property of said receptor protein or a salt thereof to an ionizable metal element or a salt thereof.

5           [12] A kit for screening an agonist for or an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which comprises (1) said receptor protein or its partial peptide, or a salt thereof and (2) a compound or element or a salt thereof that changes the binding  
10           property of said receptor protein or a salt thereof to an ionizable metal element or a salt thereof.

          [13] An agonist for or an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which is obtainable by  
15           using the screening method according to [11] or the screening kit according to [12].

          [14] A pharmaceutical comprising an agonist for or an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof.

20           [15] A prophylactic/therapeutic agent for growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac  
25           disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, which comprises a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, or a salt thereof.

          [16] A prophylactic/therapeutic agent for hypotonic bladder induced by  
30           sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, or an agent for promoting the secretion of cytokines (e.g., IL-8), which comprises a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, or a salt thereof.

35           [17] A prophylactic/therapeutic agent for growth retardation, wounds, burn,

cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, which comprises a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

10           [18] A prophylactic/therapeutic agent for hypotonic bladder induced by sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, or an agent for promoting the secretion of cytokines (e.g., IL-8), which comprises a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

              [19] A diagnostic agent for growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

              [20] A diagnostic agent for hypotonic bladder induced by sensory decrease of the bladder, hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia),

allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[21] A prophylactic/therapeutic agent for renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises an antibody to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, or a salt thereof.

[22] A prophylactic/therapeutic agent for overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises an antibody to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, or a salt thereof.

[23] A diagnostic agent for growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises an antibody to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, or a salt thereof.

[24] A diagnostic agent for overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary

incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus or inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises an antibody to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, or a salt thereof.

10           [25] A prophylactic/therapeutic agent for renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises a polynucleotide containing the entire or part of a base sequence complementary to a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same  
15 amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

          [26] A prophylactic/therapeutic agent for overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain,  
20 bladder irritation symptoms or various disorders caused by urinary calculus, an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic  
25 dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises a polynucleotide containing the entire or part of a base sequence complementary to a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

30           [27] A method of screening a compound or its salt that changes the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1 to prevent/treat growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia,  
35 hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol

accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises using a polynucleotide comprising a polynucleotide encoding said receptor protein or its partial peptide.

[28] A method of screening a compound or a salt thereof that changes the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, to prevent/treat hypotonic bladder induced by sensory decrease of the bladder, hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, a drug to regulate the secretion of cytokines (e.g., IL-8), or a compound or a salt thereof to prevent/treat inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises using a polynucleotide comprising a polynucleotide encoding said receptor protein or its partial peptide.

[29] A kit for screening a compound or its salt that changes the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1 to prevent/treat growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises a polynucleotide comprising a polynucleotide encoding said receptor protein or its partial peptide.

[30] A kit for screening a compound or a salt thereof that changes the expression level of a G protein-coupled receptor protein comprising the same or

substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, to prevent/treat hypotonic bladder induced by sensory decrease of the bladder, hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, a drug to regulate the secretion of cytokines (e.g., IL-8), or a drug to prevent/treat inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises a polynucleotide comprising a polynucleotide encoding said receptor protein or its partial peptide.

[31] A compound or its salt that changes the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide to prevent/treat growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which is obtainable by using the screening method according to [27] or the screening kit according to [29].

[32] A compound or a salt thereof that changes the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, to prevent/treat hypotonic bladder induced by sensory decrease of the bladder, hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, a drug to regulate the secretion of cytokines (e.g., IL-8), or a compound or a salt thereof to prevent/treat inflammatory diseases

(e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which is obtainable by using the screening method according to [28] or the screening kit according to [30].

[33] A prophylactic/therapeutic agent for growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, which comprises a compound or its salt that increases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[34] A prophylactic/therapeutic agent for hypotonic bladder induced by sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, or an agent for promoting the secretion of cytokines (e.g., IL-8), which comprises a compound or its salt that increases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[35] A prophylactic/therapeutic agent for renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises a compound or its salt that decreases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[36] A prophylactic/therapeutic agent for overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.;

cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises a compound or its salt that decreases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[37] A method of preventing/treating growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia, which comprises administering to a mammal an effective dose of (i) a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that increases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[38] A method of preventing/treating hypotonic bladder induced by sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, or a method of promoting the secretion of cytokines (e.g., IL-8), which comprises administering to a mammal an effective dose of (i) a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its

salt that increases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[39] A method of preventing/treating renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease, which comprises administering to a mammal an effective dose of (i) an antibody to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising the entire or part of a base sequence complementary to a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that decreases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[40] A method of preventing/treating overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, a method of suppressing the expression of cytokines (e.g., IL-8), or a method of preventing/treating inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), which comprises administering to a mammal an effective dose of (i) an antibody to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising the entire or part of a base sequence complementary to a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an antagonist to a G protein-coupled receptor

protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that decreases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide.

[41] Use of (i) a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that increases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, to manufacture a prophylactic/therapeutic agent for growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression or menoxenia.

[42] Use of (i) a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that increases the expression level of a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, to manufacture a prophylactic/therapeutic agent for hypotonic

bladder induced by sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, or an agent for promoting the secretion of cytokines (e.g., IL-8).

[43] Use of (i) an antibody to a G protein-coupled receptor protein  
 5 comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising the entire or part of a base sequence complementary to a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the  
 10 amino acid sequence represented by SEQ ID NO: 1, or its partial peptide,  
 (iii) an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that decreases the expression level of a G protein-coupled receptor protein comprising the same or  
 15 substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, to manufacture a prophylactic/therapeutic agent for renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease.

[44] Use of (i) an antibody to a G protein-coupled receptor protein  
 20 comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, its partial peptide, or a salt thereof, (ii) a polynucleotide comprising the entire or part of a base sequence complementary to a polynucleotide comprising a polynucleotide encoding a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the  
 25 amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, (iii) an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, or (iv) a compound or its salt that decreases the expression level of a G protein-coupled receptor protein comprising the same or  
 30 substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or its partial peptide, to manufacture a prophylactic/therapeutic agent for overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various  
 35 disorders caused by urinary calculus, an agent for suppressing the secretion of

cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)).

The present invention further provides the following features and so on.

[45] The screening method according to [1], wherein comparison is made between (i) the case where a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1 (hereinafter briefly referred to as GPR39), its partial peptide, or a salt thereof is brought in contact with an ionizable metal element (hereinafter briefly referred to as a metal element) or a salt thereof and (ii) the case where GPR39, its partial peptide, or a salt thereof is brought in contact with a metal element or a salt thereof and a test compound or element or a salt thereof.

[46] The screening method according to [1], wherein the binding amount of a metal element to GPR39, its partial peptide, or a salt thereof is assayed (i) when a radioisotope of the metal element is brought in contact with GPR39, its partial peptide, or a salt thereof and (ii) when a radioisotope of the metal element and a test compound or element or a salt thereof are brought in contact with GPR39, its partial peptide, or a salt thereof, followed by comparison of (i) and (ii).

[47] The screening method according to [1], wherein the binding amount of a radioisotope of metal element to a cell containing GPR39 is assayed (i) when the radioisotope of metal element is brought in contact with a cell containing GPR39 and (ii) when the radioisotope of metal element and a test compound or element or a salt thereof are brought in contact with the cell, followed by comparison of (i) and (ii).

[48] The screening method according to [1], wherein the binding amount of a radioisotope of metal element to a membrane fraction of a cell containing GPR39 is assayed (i) when the radioisotope of metal element is brought in contact with a membrane fraction of the cell containing GPR39 and (ii) when the radioisotope of metal element and a test compound or element or a salt thereof are brought in contact with a membrane fraction of the cell, followed by comparison of (i) and (ii).

[49] The screening method according to [1], wherein the binding amount of a radioisotope of metal element to GPR39 is assayed (i) when the radioisotope of metal element is brought in contact with GPR39 expressed on the cell membrane of a transformant by culturing the transformant transformed with a recombinant vector

bearing a DNA comprising a DNA encoding GPR39 and (ii) when the radioisotope of metal element and a test compound or element or a salt thereof are brought in contact with GPR39 expressed on the cell membrane of said transformant, followed by comparison of (i) and (ii).

5           [50] The screening method according to [1], wherein the cell stimulating activity mediated by GPR39 is assayed (i) when a compound or element or a salt thereof that activates GPR39 is brought in contact with a cell containing GPR39 and (ii) when a compound or element or a salt thereof that activates GPR39 and a test compound or element or a salt thereof are brought in contact with the cell containing  
10 GPR39, followed by comparison of (i) and (ii).

          [51] The screening method according to [1], the cell stimulating activity mediated by GPR39 is assayed (i) when a compound or element or a salt thereof that activates GPR39 is brought in contact with GPR39 expressed on the cell membrane of a transformant by culturing the transformant transformed with a recombinant  
15 vector bearing a DNA comprising a DNA encoding GPR39 and (ii) when a compound or element or a salt thereof that activates GPR39 and a test compound or element or a salt thereof are brought in contact with GPR39 expressed on the cell membrane of a transformant by culturing the transformant transformed with a recombinant vector bearing a DNA comprising a DNA encoding GPR39, followed  
20 by comparison of (i) and (ii).

          [52] The screening method according to [50] or [51], wherein the element that activates GPR39 is an ionizable metal element.

          [53] The screening kit according to [3] or [10], which comprises a cell containing GPR39 or its membrane fraction.

25           [54] The screening kit according to [3] or [10], which comprises GPR39 expressed on the cell membrane of a transformant by culturing the transformant transformed with a recombinant vector bearing a DNA comprising a DNA encoding GPR39.

          [55] A method for confirming that a drug for preventing/treating growth  
30 retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness,  
35 wrinkles, saggings, hypothyroidism, depression or menoxenia, renal dysfunction,

pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease binds to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which comprises using said receptor protein or a salt thereof.

5           [56] A method for confirming that a drug for preventing/treating hypotonic bladder induced by sensory decrease of the bladder, hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, 10 bladder irritation symptoms or various disorders caused by urinary calculus, an agent for regulating the secretion of cytokines (e.g., IL-8) or a drug for preventing/treating inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia) or allergic diseases (e.g., asthma, atopic 15 dermatitis or chronic obstructive pulmonary disease (COPD)) binds to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which comprises using said receptor protein, or a salt thereof.

          [57] A method for confirming that a drug for preventing/treating growth 20 retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, 25 wrinkles, saggings, hypothyroidism, depression or menoxenia is an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which comprises using said receptor protein or a salt thereof.

          [58] A method for confirming that a drug for preventing/treating hypotonic 30 bladder induced by sensory decrease of the bladder or hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs or a drug for promoting the secretion of cytokines (e.g., IL-8) is an agonist for a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which 35 comprises using said receptor protein or a salt thereof.

[59] A method for confirming that a drug for preventing/treating renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy or Wilson's disease is an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which comprises using said receptor protein or a salt thereof.

[60] A method for confirming that a drug for preventing/treating overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria, prostatic hyperplasia-induced pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms or various disorders caused by urinary calculus, a drug for suppressing the secretion of cytokines (e.g., IL-8) or a drug for preventing/treating inflammatory diseases (e.g., diabetic complications such as neuropathy, macroangiopathy, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia) or allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)) is an antagonist to a G protein-coupled receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1, or a salt thereof, which comprises using said receptor protein or a salt thereof.

[61] The method for confirming according to [55] through [60], wherein the binding amount of each drug to said receptor protein, its partial peptide, or a salt thereof is assayed when each drug is brought in contact with said receptor protein, its partial peptide, or a salt thereof.

## BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 shows the results obtained by monitoring changes in intracellular calcium levels when cadmium chloride was added to human GPR39-GFP expression vector-transfected CHO cell line (CHO/hGPR39-GFP). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\square$  (open square) designates the case where 300  $\mu$ M of cadmium chloride was added, symbol  $\triangle$  (open triangle) designates the case where 100  $\mu$ M of cadmium chloride was added and symbol  $\circ$  designates the case where 10  $\mu$ M of cadmium chloride was added.

FIG. 2 shows the results obtained by monitoring changes in intracellular calcium levels when zinc chloride was added to human GPR39-GFP expression

vector-transfected CHO cell line (CHO/hGPR39-GFP). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\square$  (open square) designates the case where 300  $\mu$ M of zinc chloride was added, symbol  $\triangle$  (open triangle) designates the case where 100  $\mu$ M of zinc chloride was added and symbol  $\circ$  designates the case where 10  $\mu$ M of zinc chloride was added.

FIG. 3 shows the results obtained by monitoring changes in intracellular calcium levels when copper chloride was added to human GPR39-GFP expression vector-transfected CHO cell line (CHO/hGPR39-GFP). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\square$  (open square) designates the case where 300  $\mu$ M of copper chloride was added, symbol  $\triangle$  (open triangle) designates the case where 100  $\mu$ M of copper chloride was added and symbol  $\circ$  (open circle) designates the case where 10  $\mu$ M of copper chloride was added.

FIG. 4 shows the results obtained by monitoring changes in intracellular calcium levels when nickel chloride was added to human GPR39-GFP expression vector-transfected CHO cell line (CHO/hGPR39-GFP). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\square$  (open square) designates the case where 300  $\mu$ M of nickel chloride was added, symbol  $\triangle$  (open triangle) designates the case where 100  $\mu$ M of nickel chloride was added and symbol  $\circ$  (open circle) designates the case where 10  $\mu$ M of nickel chloride was added.

FIG. 5 shows the expression distribution of GPR39 mRNA in human tissues. "Copies/25 ng total RNA" designates the number of copies per 25 ng of total RNA.

FIG. 6 shows the expression level of GPR39 mRNA in human primary culture cells. "Copies/25 ng total RNA" designates the number of copies per 25 ng of total RNA.

FIG. 7 shows the expression of GPR39 mRNA in human colon cancer cell line. "Copies/25 ng total RNA" designates the number of copies per 25 ng of total RNA.

FIG. 8 shows the results obtained by monitoring pH changes in extracellular fluids using a cytosensor, when nickel chloride was added to human GPR39 expression vector-transfected CHO cell line (CHO/hGPR39). "Cycles" designates the number of detecting the rate of pH change after the addition. "Change of Acidification Rate (%)" designates pH changes (acidification rate) in extracellular

fluids and reflects the cell respiration rate. Symbols  $\blacklozenge$  (closed diamond),  $\blacktriangle$  (closed triangle) and  $\square$  (open square) designate GPR39-expressed cells, TGR7-expressed cells and mock cells, respectively.

FIG. 9 shows the results obtained by monitoring changes in intracellular calcium levels when cobalt chloride was added to rat GPR39 expression vector-transfected CHO cell line (CHO/rGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 3000  $\mu\text{M}$  of cobalt chloride was added, symbol  $\square$  (open square) designates the case where 1000  $\mu\text{M}$  of cobalt chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 300  $\mu\text{M}$  of cobalt chloride was added.

FIG. 10 shows the results obtained by monitoring changes in intracellular calcium levels when nickel chloride was added to rat GPR39 expression vector-transfected CHO cell line (CHO/rGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 100  $\mu\text{M}$  of nickel chloride was added, symbol  $\square$  (open square) designates the case where 30  $\mu\text{M}$  of nickel chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 10  $\mu\text{M}$  of nickel chloride was added.

FIG. 11 shows the results obtained by monitoring changes in intracellular calcium levels when copper chloride was added to rat GPR39 expression vector-transfected CHO cell line (CHO/rGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 100  $\mu\text{M}$  of copper chloride was added, symbol  $\square$  (open square) designates the case where 30  $\mu\text{M}$  of copper chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 10  $\mu\text{M}$  of copper chloride was added.

FIG. 12 shows the results obtained by monitoring changes in intracellular calcium levels when zinc chloride was added to rat GPR39 expression vector-transfected CHO cell line (CHO/rGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 100  $\mu\text{M}$  of zinc chloride was added, symbol  $\square$  (open square) designates the case where 30  $\mu\text{M}$  of zinc chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 10  $\mu\text{M}$  of zinc chloride was added.

FIG. 13 shows the results obtained by monitoring changes in intracellular calcium levels when cadmium chloride was added to rat GPR39 expression vector-transfected CHO cell line (CHO/rGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 3000  $\mu\text{M}$  of cadmium chloride was added, symbol  $\square$  (open square) designates the case where 1000  $\mu\text{M}$  of cadmium chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 300  $\mu\text{M}$  of cadmium chloride was added.

FIG. 14 shows the results obtained by monitoring changes in intracellular calcium levels when nickel chloride was added to mouse GPR39 expression vector-transfected CHO cell line (CHO/mGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 300  $\mu\text{M}$  of nickel chloride was added, symbol  $\square$  (open square) designates the case where 100  $\mu\text{M}$  of nickel chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 30  $\mu\text{M}$  of nickel chloride was added.

FIG. 15 shows the results obtained by monitoring changes in intracellular calcium levels when cobalt chloride was added to mouse GPR39 expression vector-transfected CHO cell line (CHO/mGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 3000  $\mu\text{M}$  of cobalt chloride was added, symbol  $\square$  (open square) designates the case where 1000  $\mu\text{M}$  of cobalt chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 300  $\mu\text{M}$  of cobalt chloride was added.

FIG. 16 shows the results obtained by monitoring changes in intracellular calcium levels when copper chloride was added to mouse GPR39 expression vector-transfected CHO cell line (CHO/mGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 300  $\mu\text{M}$  of copper chloride was added, symbol  $\square$  (open square) designates the case where 100  $\mu\text{M}$  of copper chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 30  $\mu\text{M}$  of copper chloride was added.

FIG. 17 shows the results obtained by monitoring changes in intracellular calcium levels when zinc chloride was added to mouse GPR39 expression vector-transfected CHO cell line (CHO/mGPR39). "Time (sec)" designates a time

period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 300  $\mu\text{M}$  of zinc chloride was added, symbol  $\square$  (open square) designates the case where 100  $\mu\text{M}$  of zinc chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 30  $\mu\text{M}$  of zinc chloride was added.

FIG. 18 shows the results obtained by monitoring changes in intracellular calcium levels when cadmium chloride was added to mouse GPR39 expression vector-transfected CHO cell line (CHO/mGPR39). "Time (sec)" designates a time period (second) after the addition. "Counts" designates changes in intracellular calcium levels. Symbol  $\diamond$  (open diamond) designates the case where 3000  $\mu\text{M}$  of cadmium chloride was added, symbol  $\square$  (open square) designates the case where 1000  $\mu\text{M}$  of cadmium chloride was added, and symbol  $\triangle$  (open triangle) designates the case where 300  $\mu\text{M}$  of cadmium chloride was added.

FIG. 19 shows the tissue distribution of GPR39 mRNA in rats by RT-PCR. "Copies/25 ng total RNA" designates the number of copies per 25 ng of total RNA.

FIG. 20 shows the expression level of GPR39 mRNA in cell lines by RT-PCR. "Cell lines" on the abscissa designates cell lines, and "human," "mouse" and "rat" designate human, mouse and rat, respectively. "Copies/25 ng total RNA" designates the number of copies per 25 ng of total RNA.

## BEST MODE FOR CARRYING OUT THE INVENTION

The G protein-coupled receptor protein GPR39 used in the present invention (hereinafter sometimes briefly referred to as GPR39) is a receptor protein comprising the same or substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1.

GPR39 may be any protein derived from, for example, any cell of human and mammal (e.g., guinea pig, rat, mouse, rabbit, swine, sheep, bovine, monkey, etc.); any cell (e.g., splenocyte, nerve cells, glial cells,  $\beta$  cells of pancreas, bone marrow cells, mesangial cells, Langerhans' cells, epidermic cells, epithelial cells, endothelial cells, fibroblasts, fibrocytes, myocytes, fat cells, immune cells (e.g., macrophage, T cells, B cells, natural killer cells, mast cells, neutrophils, basophils, eosinophils, monocytes), megakaryocytes, synovial cells, chondrocytes, bone cells, osteoblasts, osteoclasts, mammary gland cells, hepatocytes or interstitial cells; or the corresponding precursor cells, stem cells, cancer cells, etc.) or cells originated from blood cells; or any tissues where such cells are present, such as brain or any of brain

regions (e.g., olfactory bulb, amygdaloid nucleus, basal ganglia, hippocampus, thalamus, hypothalamus, cerebral cortex, medulla oblongata, cerebellum, occipital pole, frontal lobe, temporal lobe, putamen, caudate nucleus, corpus callosum, substantia nigra), spinal cord, hypophysis, stomach, pancreas, kidney, liver, gonad, thyroid, gall-bladder, bone marrow, adrenal gland, skin, muscle, lung, gastrointestinal tract (e.g., large intestine and small intestine), intestinal tract, blood vessel, heart, thymus, spleen, submandibular gland, peripheral blood, peripheral blood cells, prostate, testicle, testis, ovary, placenta, uterus, bone, joint, skeletal muscle, bladder, etc.; in particular, GPR39 may be proteins derived from bladder, central nervous  
 5 tissues, hypophysis, kidney, gastrointestinal tract tissues, fetal brain, primary cultured cells from blood vessels, primary cultured cells from the kidney or colon cancer cell lines, or may be synthetic proteins.  
 10

The amino acid sequence comprising substantially the same amino acid sequence as the amino acid sequence includes, for example, an amino acid sequence  
 15 having at least about 80% homology, preferably at least about 90% homology and more preferably at least about 95% homology, to the amino acid sequence represented by SEQ ID NO: 1, and the like.

Examples of the protein of the present invention comprising substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID  
 20 NO: 1 include a protein comprising substantially the same amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1 and preferably having the activity substantially equivalent to the protein consisting of the amino acid sequence represented by SEQ ID NO: 1, etc.

Homology of the amino acid sequences can be measured under the  
 25 following conditions (Expectation value = 10; gaps are allowed; matrix=BLOSUM62; filtering = OFF) using a homology scoring algorithm NCBI BLAST (National Center for Biotechnology Information Basic Local Alignment Search Tool).

Examples of the substantially equivalent activity include a ligand binding  
 30 activity, a signal transduction activity, etc. The term substantially equivalent is used to mean that the activities are the same in nature. Although it is preferred that activities such as the ligand binding and signal transduction activities, etc. be equivalent (e.g., about 0.01- to about 100-fold, preferably about 0.5- to about 20-fold, more preferably about 0.5- to about 2-fold), quantitative factors such as a level of  
 35 these activities, a molecular weight of the protein, etc. may differ.

The activities such as ligand binding and signal transduction activities or the like can be determined according to publicly known methods, for example, by the ligand determination methods or the screening methods that will be later described.

Also, proteins having the following amino acid sequences are used as

- 5 GPR39: a) amino acid sequences wherein at least 1 or 2 amino acids (preferably approximately 1 to 30 amino acids, more preferably approximately 1 to 10 amino acids and most preferably several (1 to 5) amino acids) are deleted of the amino acid sequence represented by SEQ ID NO: 1, SEQ ID NO: 6 or SEQ ID NO: 8; b) amino acid sequences wherein at least 1 or 2 amino acids (preferably approximately 1 to 30  
10 amino acids, more preferably approximately 1 to 10 amino acids and most preferably several (1 to 5) amino acids) are added to the amino acid sequence represented by SEQ ID NO: 1, SEQ ID NO: 6 or SEQ ID NO: 8; c) amino acid sequences wherein at least 1 or 2 amino acids (preferably approximately 1 to 30 amino acids, more preferably approximately 1 to 10 amino acids and most preferably several (1 to 5)  
15 amino acids) in the amino acid sequence represented by SEQ ID NO: 1, SEQ ID NO: 6, or SEQ ID NO: 8 are substituted by other amino acids; or d) combination of these amino acid sequences described above; and the like.

Throughout the present specification, GPR39 is represented in accordance with the conventional way of describing peptides, that is, the N-terminus (amino  
20 terminus) at the left hand and the C-terminus (carboxyl terminus) at the right hand. In GPR39 including GPR39 comprising the amino acid sequence shown by SEQ ID NO: 1, the C-terminus may be in any form of a carboxyl group (-COOH), carboxylate (-COO<sup>-</sup>), an amide (-CONH<sub>2</sub>) or an ester (-COOR).

Examples of the ester group shown by R include a C<sub>1-6</sub> alkyl group such as  
25 methyl, ethyl, n-propyl, isopropyl, n-butyl, etc.; a C<sub>3-8</sub> cycloalkyl group such as cyclopentyl, cyclohexyl, etc.; a C<sub>6-12</sub> aryl group such as phenyl,  $\alpha$ -naphthyl, etc.; a C<sub>7-14</sub> aralkyl group such as a phenyl-C<sub>1-2</sub>-alkyl group, e.g., benzyl, phenethyl, etc., or an  $\alpha$ -naphthyl-C<sub>1-2</sub>-alkyl group such as  $\alpha$ -naphthylmethyl, etc.; and the like. In addition, pivaloyloxymethyl or the like, which is used widely as an ester for oral  
30 administration, may also be used.

Where GPR39 contains a carboxyl group (or a carboxylate) at a position other than the C-terminus, it may be amidated or esterified and such an amide or ester is also included within GPR39. The ester group may be the same group as that described with respect to the C-terminus described above.

35 Furthermore, examples of GPR39 include variants of the above proteins,

wherein the amino group at the N-terminal methionine residue of the protein supra is protected with a protecting group (for example, a C<sub>1-6</sub> acyl group such as a C<sub>2-6</sub> alkanoyl group, e.g., formyl group, acetyl group, etc.); those wherein the N-terminal region is cleaved in vivo and the glutamyl group thus formed is pyroglutaminated;  
5 those wherein a substituent (e.g., -OH, -SH, amino group, imidazole group, indole group, guanidino group, etc.) on the side chain of an amino acid in the molecule is protected with a suitable protecting group (e.g., a C<sub>1-6</sub> acyl group such as a C<sub>2-6</sub> alkanoyl group, e.g., formyl group, acetyl group, etc.), or conjugated proteins such as glycoproteins bound to sugar chains.

10 Specific examples of GPR39 include human-derived GPR39 consisting of the amino acid sequence represented by SEQ ID NO: 1, mouse-derived GPR39 consisting of the amino acid sequence represented by SEQ ID NO: 6, rat-derived GPR39 consisting of the amino acid sequence represented by SEQ ID NO: 8, etc. Human-derived GPR39 is a publicly known protein described in Genomics, 1997  
15 Dec 15; 46(3): 426-34, WO2002/61087, US2002/004491, WO2002/39885, WO2002/71928, WO2001/81634, WO2002/79492 or WO2002/86443.

As the partial peptide of GPR39 (hereinafter sometimes referred to as the partial peptide), any partial peptide can be used so long as it can be a partial peptide of the aforesaid GPR39. Among GPR39 protein molecules, for example, those  
20 having a site exposed to the outside of a cell membrane and having substantially the same receptor binding activity can be used.

Specifically, the partial peptide of GPR39 having the amino acid sequence represented by SEQ ID NO: 1, SEQ ID NO: 6 or SEQ ID NO: 8 is a peptide containing the parts analyzed to be extracellular domains (hydrophilic domains) in  
25 the hydrophobic plotting analysis. A peptide containing a hydrophobic domain in part can be used as well. In addition, the peptide may contain each domain separately or plural domains together.

In the partial peptides of the present invention, preferred are peptides having at least 20, preferably at least 50, and more preferably at least 100 amino acids, in the  
30 amino acid sequence which constitutes the receptor protein of the present invention described above.

The amino acid sequence having substantially the same amino acid sequence includes an amino acid sequence having at least about 85% homology, preferably at least about 90% homology and more preferably at least about 95%  
35 homology, to these amino acid sequences.

Homology in the amino acid sequence can be measured under the same conditions using the homology scoring algorithm NCBI BLAST as described above.

Herein the term "substantially the same receptor activity" has the same significance as described above. The "substantially the same receptor activity" can be  
5 assayed by the same manner as described above.

In the amino acid sequence described above, the partial peptide of the present invention may contain amino acid sequences, of which at least 1 or 2 amino acids (preferably approximately 1 to 10 amino acids, more preferably several (1 to 5) amino acids) are deleted; to which at least 1 or 2 amino acids (preferably  
10 approximately 1 to 20 amino acids, more preferably approximately 1 to 10 amino acids, and most preferably several (1 to 5) amino acids) are added; or, in which at least 1 or 2 amino acids (preferably approximately 1 to 10 amino acids, more preferably several and most preferably approximately 1 to 5 amino acids) are substituted by other amino acids.

15 In the partial peptide of the present invention, the C-terminus may be in any form of a carboxyl group (-COOH), carboxylate (-COO<sup>-</sup>), an amide (-CONH<sub>2</sub>) or an ester (-COOR). Where the partial peptide contains a carboxyl group (or a carboxylate) at a position other than the C-terminus, it may be amidated or esterified and such an amide or ester is also included within the partial peptide of the present  
20 invention. In this case, the ester group may be the same group as that described with respect to the C-terminus described above.

As in GPR39 described above, the partial peptide of the present invention further includes those in which the amino group of the amino acid residue of the N-terminal methionine residue is protected by a protecting group, those in which the  
25 N-terminal residue is cleaved in vivo and the produced glutamine residue is pyroglutaminated, those in which substituents on the side chains of amino acids in the molecule are protected by appropriate protecting groups, conjugated peptides such as so-called glycopeptides, to which sugar chains are bound, and the like.

For salts of GPR39 or its partial peptide, preferred are physiologically  
30 acceptable salts with acids or bases, especially physiologically acceptable acid addition salts. Examples of the salts include salts with, for example, inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid); salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid,  
35 methanesulfonic acid, benzenesulfonic acid) and the like.

GPR39 or salts thereof may be manufactured by a publicly known method used to purify receptor proteins from human or mammalian cells or tissues described above, or by culturing a transformant that contains the DNA encoding GPR39, as will be later described. Furthermore, GPR39 or its salts may also be manufactured by the methods for synthesizing proteins or by modifications thereof, which will also be described hereinafter.

Where GPR39 or its salts are produced from human or mammalian tissues or cells, human or mammalian tissues or cells are homogenized, then extracted with an acid or the like, and the extract is isolated and purified by a combination of chromatography techniques such as reverse phase chromatography, ion exchange chromatography, and the like.

To synthesize GPR39 or its partial peptides, or salts or amides thereof, commercially available resins that are used for protein synthesis may be used. Examples of such resins include chloromethyl resin, hydroxymethyl resin, benzhydrylamine resin, aminomethyl resin, 4-benzyloxybenzyl alcohol resin, 4-methylbenzhydrylamine resin, PAM resin, 4-hydroxymethylmethylphenyl acetamidomethyl resin, polyacrylamide resin, 4-(2',4'-dimethoxyphenylhydroxymethyl)phenoxy resin, 4-(2',4'-dimethoxyphenyl-Fmoc-aminoethyl) phenoxy resin, etc. Using these resins, amino acids in which  $\alpha$ -amino groups and functional groups on the side chains are appropriately protected are condensed on the resin in the order of the sequence of the objective protein according to various condensation methods publicly known in the art. At the end of the reaction, the protein is cut out from the resin and at the same time, the protecting groups are removed. Then, intramolecular disulfide bond-forming reaction is performed in a highly diluted solution to obtain the objective protein or its amides.

For condensation of the protected amino acids described above, a variety of activation reagents for protein synthesis may be used, and carbodiimides are particularly preferable. Examples of such carbodiimides include DCC, N,N'-diisopropylcarbodiimide, N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide, etc.

For activation by these reagents, the protected amino acids in combination with a racemization inhibitor (e.g., HOBt, HOObt) are added directly to the resin, or the protected amino acids are previously activated in the form of symmetric acid anhydrides, HOBt esters or HOObt esters, followed by adding the thus activated protected amino acids to the resin.

Solvents suitable for use to activate the protected amino acids or condense

with the resin may be chosen from solvents known to be usable for protein condensation reactions. Examples of such solvents are acid amides such as N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidone, etc.; halogenated hydrocarbons such as methylene chloride, chloroform, etc.; alcohols  
 5 such as trifluoroethanol, etc.; sulfoxides such as dimethylsulfoxide, etc.; ethers such as pyridine, dioxane, tetrahydrofuran, etc.; nitriles such as acetonitrile, propionitrile, etc.; esters such as methyl acetate, ethyl acetate, etc.; and appropriate mixtures of these solvents. The reaction temperature is appropriately chosen from the range known to be applicable to protein binding reactions and is usually selected in the  
 10 range of approximately -20°C to 50°C. The activated amino acid derivatives are used generally in an excess of 1.5 to 4 times. The condensation is examined by a test using the ninhydrin reaction; when the condensation is insufficient, the condensation can be completed by repeating the condensation reaction without removal of the protecting groups. When the condensation is yet insufficient even after repeating the  
 15 reaction, unreacted amino acids are acetylated with acetic anhydride or acetylimidazole.

Examples of the protecting groups used to protect the amino groups of the starting compounds include Z, Boc, t-pentyloxycarbonyl, isobornyloxycarbonyl, 4-methoxybenzyloxycarbonyl, Cl-Z, Br-Z, adamantyloxycarbonyl, trifluoroacetyl,  
 20 phthaloyl, formyl, 2-nitrophenylsulphenyl, diphenylphosphinothioyl, Fmoc, etc.

A carboxyl group can be protected by, e.g., alkyl esterification (in the form of linear, branched or cyclic alkyl esters of the alkyl moiety such as methyl, ethyl, propyl, butyl, t-butyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl, 2-adamantyl, etc.), aralkyl esterification (e.g., esterification in the form of benzyl ester,  
 25 4-nitrobenzyl ester, 4-methoxybenzyl ester, 4-chlorobenzyl ester, benzhydryl ester, etc.), phenacyl esterification, benzyloxycarbonyl hydrazidation, t-butoxycarbonyl hydrazidation, trityl hydrazidation, or the like.

The hydroxyl group of serine can be protected through, for example, its esterification or etherification. Examples of groups appropriately used for the  
 30 esterification include a lower alkanoyl group, such as acetyl group, an aroyl group such as benzoyl group, and a group derived from carbonic acid such as benzyloxycarbonyl group, ethoxycarbonyl group, etc. Examples of a group appropriately used for the etherification include benzyl group, tetrahydropyranyl group, t-butyl group, etc.

35 Examples of groups for protecting the phenolic hydroxyl group of tyrosine

include Bzl, Cl<sub>2</sub>-Bzl, 2-nitrobenzyl, Br-Z, t-butyl, etc.

Examples of groups used to protect the imidazole moiety of histidine include Tos, 4-methoxy-2,3,6-trimethylbenzenesulfonyl, DNP, benzyloxymethyl, Bum, Boc, Trt, Fmoc, etc.

5        Examples of the activated carboxyl groups used in the starting compounds include the corresponding acid anhydrides, azides, activated esters [esters with alcohols (e.g., pentachlorophenol, 2,4,5-trichlorophenol, 2,4-dinitrophenol, cyanomethyl alcohol, p-nitrophenol, HONB, N-hydroxysuccinimide, N-hydroxyphthalimide, HOBt)], etc.

10        As the activated amino acids, in which the amino groups are activated in the starting material, for example, the corresponding phosphoric amides are employed.

To eliminate (split off) the protecting groups, there are used catalytic reduction under hydrogen gas flow in the presence of a catalyst such as Pd-black, Pd-carbon, etc.; an acid treatment with anhydrous hydrogen fluoride,  
 15        methanesulfonic acid, trifluoromethane-sulfonic acid or trifluoroacetic acid, or a mixture solution of these acids; a treatment with a base such as diisopropylethylamine, triethylamine, piperidine, piperazine, etc.; and reduction with sodium in liquid ammonia. The elimination of the protecting group by the acid treatment described above is carried out generally at a temperature of approximately  
 20        -20°C to 40°C. In the acid treatment, it is efficient to add a cation scavenger such as anisole, phenol, thioanisole, m-cresol, p-cresol, dimethylsulfide, 1,4-butanedithiol, 1,2-ethanedithiol, etc. Furthermore, 2,4-dinitrophenyl group known as the protecting group for the imidazole of histidine is removed by a treatment with thiophenol. Formyl group used as the protecting group of the indole of tryptophan is eliminated  
 25        by the aforesaid acid treatment in the presence of 1,2-ethanedithiol, 1,4-butanedithiol, etc. as well as by a treatment with an alkali such as a dilute sodium hydroxide solution, dilute ammonia, etc.

Protection of the functional groups that should not be involved in the reaction of the starting materials, protecting groups, elimination of the protecting  
 30        groups, activation of functional groups involved in the reaction, or the like may be appropriately selected from publicly known groups and publicly known means.

In another method for obtaining the amides of the protein, for example, the  $\alpha$ -carboxyl group of the carboxy terminal amino acid is first protected by amidation; the peptide (protein) chain is then extended from the amino group side to a desired  
 35        length. Thereafter, a protein in which only the protecting group of the N-terminal

$\alpha$ -amino group in the peptide chain has been eliminated from the protein and a protein in which only the protecting group of the C-terminal carboxyl group has been eliminated are prepared. The two proteins are condensed in a mixture of the solvents described above. The details of the condensation reaction are the same as described above. After the protected protein obtained by the condensation is purified, all the protecting groups are eliminated by the method described above to give the desired crude protein. This crude protein is purified by various known purification means. Lyophilization of the major fraction gives the amide of the desired protein.

To prepare the esterified protein, for example, the  $\alpha$ -carboxyl group of the carboxy terminal amino acid is condensed with a desired alcohol to prepare the amino acid ester, which is followed by procedure similar to the preparation of the amidated protein above to give the ester form of the desired protein.

The partial peptide or its salts in GPR39 can be manufactured by publicly known methods for peptide synthesis, or by cleaving GPR39 with an appropriate peptidase. For the methods for peptide synthesis, for example, either solid phase synthesis or liquid phase synthesis may be used. That is, the partial peptide or amino acids that can construct GPR39 are condensed with the remaining part. Where the product contains protecting groups, these protecting groups are removed to give the desired peptide. Publicly known methods for condensation and elimination of the protecting groups are described in a) - e) below.

a) M. Bodanszky & M.A. Ondetti: Peptide Synthesis, Interscience Publishers, New York (1966)

b) Schroeder & Luebke: The Peptide, Academic Press, New York (1965)

c) Nobuo Izumiya, et al.: *Peptide Gosei-no-Kiso to Jikken* (Basics and experiments of peptide synthesis), published by Maruzen Co. (1975)

d) Haruaki Yajima & Shunpei Sakakibara: *Seikagaku Jikken Koza* (Biochemical Experiment) 1, *Tanpakushitsu no Kagaku* (Chemistry of Proteins) IV, 205 (1977)

e) Haruaki Yajima, ed.: *Zoku Iyaku hin no Kaihatsu* (A sequel to Development of Pharmaceuticals), Vol. 14, Peptide Synthesis, published by Hirokawa Shoten

After completion of the reaction, the product may be purified and isolated by a combination of conventional purification methods such as solvent extraction, distillation, column chromatography, liquid chromatography and recrystallization to give the partial peptide of the present invention. When the partial peptide obtained by

the methods above is in a free form, the peptide can be converted into an appropriate salt by a publicly known method; conversely when the peptide is obtained in a salt form, it can be converted into a free form by a publicly known method.

The polynucleotide encoding GPR39 may be any polynucleotide so long as  
 5 it contains the base sequence (DNA or RNA, preferably DNA) encoding GPR39 described above. Such a polynucleotide may also be any one of DNA encoding GPR39, RNA such as mRNA, etc., and may be double-stranded or single-stranded. Where the polynucleotide is double-stranded, it may be double-stranded DNA, double-stranded RNA or DNA:RNA hybrid. Where the polynucleotide is  
 10 single-stranded, it may be a sense strand (i.e., a coding strand) or an antisense strand (i.e., a non-coding strand).

Using the polynucleotide encoding GPR39, mRNA of GPR39 can be quantified by, for example, the publicly known method published in separate volume of *Jikken Igaku*, 15 (7) "New PCR and its application" (1997), or by its  
 15 modifications.

The DNA encoding GPR39 may be any of genomic DNA, genomic DNA library, cDNA derived from the cells and tissues described above, cDNA library derived from the cells and tissues described above and synthetic DNA. The vector to be used for the library may be any of bacteriophage, plasmid, cosmid and phagemid.  
 20 The DNA may also be directly amplified by reverse transcriptase polymerase chain reaction (hereinafter abbreviated as RT-PCR) using the total RNA or mRNA fraction prepared from the cells and tissues described above.

Specifically, the DNA encoding GPR39 may be any DNA, so long as it is, for example, a DNA containing the base sequence represented by SEQ ID NO: 2, or  
 25 any DNA having a base sequence hybridizable to the base sequence represented by SEQ ID NO: 2 under high stringent conditions and encoding a receptor protein, which has the activity substantially equivalent to that of GPR39 consisting of the amino acid sequence as the amino acid sequence represented by SEQ ID NO: 1 (e.g., the ligand-binding activities, the signal transduction activities, cytokine (e.g., IL-8)  
 30 secretion-promoting activities, etc.).

Examples of the DNA hybridizable to the DNA containing the base sequence represented by SEQ ID NO: 2 include a DNA containing a base sequence having at least about 80% homology, preferably at least about 90% homology and more preferably at least about 95% homology, to the base sequence represented by  
 35 SEQ ID NO: 2.

Homology of the base sequences can be measured under the following conditions (Expectation value = 10; gaps are allowed; filtering = ON; match score = 1; mismatch score = -3) using a homology scoring algorithm NCBI BLAST (National Center for Biotechnology Information Basic Local Alignment Search Tool).

The hybridization can be carried out by publicly known methods or by modifications of these methods, for example, according to the method described in Molecular Cloning, 2nd (J. Sambrook et al., Cold Spring Harbor Lab. Press, 1989). A commercially available library may also be used according to the instructions of the attached manufacturer's protocol. Preferably, the hybridization can be carried out under highly stringent conditions.

The highly stringent conditions used herein are, for example, those in a sodium concentration at about 19 to 40 mM, preferably about 19 to 20 mM at a temperature of about 50 to 70°C, preferably about 60 to 65°C. In particular, hybridization conditions in a sodium concentration of about 19 mM at a temperature of about 65°C are most preferred.

More specifically, for the DNA encoding human GPR39 containing the amino acid sequence represented by SEQ ID NO: 1, there may be employed a DNA containing the base sequence represented by SEQ ID NO: 2; etc. For the DNA encoding mouse GPR39 containing the amino acid sequence represented by SEQ ID NO: 6, there may be employed a DNA containing the base sequence represented by SEQ ID NO: 7; etc. For the DNA encoding rat GPR39 containing the amino acid sequence represented by SEQ ID NO: 8, there may be employed a DNA containing the base sequence represented by SEQ ID NO: 9; etc.

The term polynucleotide comprising a part of the base sequence of the DNA encoding GPR39 or a part of the base sequence complementary to the DNA is used to mean that the polynucleotide embraces not only the DNA encoding the partial peptide of the present invention described below but also RNA.

According to the present invention, antisense polynucleotides (nucleic acids) that can inhibit the replication or expression of GPR39 gene can be designed and synthesized based on the base sequence information of the cloned or determined DNA encoding GPR39. Such a polynucleotide (nucleic acid) is capable of hybridizing to RNA of GPR39 gene to inhibit the synthesis or function of said RNA or capable of modulating or controlling the expression of GPR39 gene via interaction with GPR39-associated RNA. Polynucleotides complementary to the selected

sequences of GPR39-associated RNA and polynucleotides specifically hybridizable to the GPR39-associated RNA are useful in modulating or controlling the expression of GPR39 gene in vivo and in vitro, and useful for the treatment or diagnosis of diseases. The term "corresponding" is used to mean homologous to or

5 complementary to a particular sequence of the nucleotide, base sequence or nucleic acid including the gene. The term "corresponding" between nucleotides, base sequences or nucleic acids and peptides (proteins) usually refer to amino acids of a peptide (protein) under the order derived from the sequence of nucleotides (nucleic acids) or their complements. In GPR39 genes, the 5' end hairpin loop, 5' end  
10 6-base-pair repeats, 5' end untranslated region, polypeptide translation initiation codon, protein coding region, ORF translation initiation codon, 3' end untranslated region, 3' end palindrome region, and 3' end hairpin loop, may be selected as preferred target regions, though any other region may be selected as a target in GPR39 genes.

15 The relationship between the targeted nucleic acids and the polynucleotides complementary to at least a part of the target, specifically the relationship between the target and the polynucleotides hybridizable to the target, can be denoted to be "antisense". Examples of the antisense polynucleotides include polydeoxyribonucleotide containing 2-deoxy-D-ribose, polyribonucleotide  
20 containing D-ribose, any other type of polynucleotides which are N-glycosides of a purine or pyrimidine base, or other polymers containing non-nucleotide backbones (e.g., protein nucleic acids and synthetic sequence-specific nucleic acid polymers commercially available) or other polymers containing nonstandard linkages (provided that the polymers contain nucleotides having such a configuration that  
25 allows base pairing or base stacking, as is found in DNA or RNA), etc. They may be double-stranded DNA, single-stranded DNA, single-stranded RNA or a DNA:RNA hybrid, and may further include unmodified polynucleotides (or unmodified oligonucleotides), those with publicly known types of modifications, for example, those with labels known in the art, those with caps, methylated polynucleotides,  
30 those with substitution of one or more naturally occurring nucleotides by their analogue, those with intramolecular modifications of nucleotides such as those with uncharged linkages (e.g., methyl phosphonates, phosphotriesters, phosphoramidates, carbamates, etc.) and those with charged linkages or sulfur-containing linkages (e.g., phosphorothioates, phosphorodithioates, etc.), those having side chain groups such as  
35 proteins (nucleases, nuclease inhibitors, toxins, antibodies, signal peptides,

poly-L-lysine, etc.), saccharides (e.g., monosaccharides, etc.), those with intercalators (e.g., acridine, psoralen, etc.), those containing chelators (e.g., metals, radioactive metals, boron, oxidative metals, etc.), those containing alkylating agents, those with modified linkages (e.g.,  $\alpha$  anomeric nucleic acids, etc.), and the like.

5 Herein the terms "nucleoside", "nucleotide" and "nucleic acid" are used to refer to moieties that contain not only the purine and pyrimidine bases, but also other heterocyclic bases, which have been modified. Such modifications may include methylated purines and pyrimidines, acylated purines and pyrimidines and other heterocyclic rings. Modified nucleotides and modified nucleotides also include  
10 modifications on the sugar moiety, wherein, for example, one or more hydroxyl groups may optionally be substituted with a halogen atom(s), an aliphatic group(s), etc., or may be converted into the corresponding functional groups such as ethers, amines, or the like.

The antisense polynucleotide (nucleic acid) of the present invention is RNA,  
15 DNA or a modified nucleic acid (RNA, DNA). Specific examples of the modified nucleic acid are, but not limited to, sulfur and thiophosphate derivatives of nucleic acids and those resistant to degradation of polynucleoside amides or oligonucleoside amides. The antisense nucleic acids of the present invention can be modified preferably based on the following design, that is, by increasing the intracellular  
20 stability of the antisense nucleic acid, increasing the cellular permeability of the antisense nucleic acid, increasing the affinity of the nucleic acid to the targeted sense strand to a higher level, or minimizing the toxicity, if any, of the antisense nucleic acid.

Many of such modifications are known in the art, as disclosed in J.  
25 Kawakami, et al., Pharm. Tech. Japan, Vol. 8, pp. 247, 1992; Vol. 8, pp. 395, 1992; S. T. Crooke, et al. ed., Antisense Research and Applications, CRC Press, 1993; etc.

The antisense nucleic acid of the present invention may contain changed or modified sugars, bases or linkages. The antisense nucleic acid may also be provided in a specialized form such as liposomes, microspheres, or may be applied to gene  
30 therapy, or may be provided in combination with attached moieties. Such attached moieties include polycations such as polylysine that act as charge neutralizers of the phosphate backbone, or hydrophobic moieties such as lipids (e.g., phospholipids, cholesterol, etc.) that enhance the interaction with cell membranes or increase uptake of the nucleic acid. Preferred examples of the lipids to be attached are  
35 cholesterol or derivatives thereof (e.g., cholesteryl chloroformate, cholic acid, etc.).

These moieties may be attached to the nucleic acid at the 3' or 5' ends thereof and may also be attached thereto through a base, sugar, or intramolecular nucleoside linkage. Other moieties may be capping groups specifically placed at the 3' or 5' ends of the nucleic acid to prevent degradation by nucleases such as exonuclease, RNase, etc. Such capping groups include, but are not limited to, hydroxyl protecting groups known in the art, including glycols such as polyethylene glycol, tetraethylene glycol and the like.

The inhibitory action of the antisense nucleic acid can be examined using the transformant of the present invention, the gene expression system of the present invention in vivo and in vitro, or the translation system of the G protein-coupled receptor protein in vivo and in vitro. The nucleic acid can be applied to cells by a variety of publicly known methods.

The DNA encoding the partial peptide of the present invention may be any DNA so long as it contains the base sequence encoding the partial peptide of the present invention described above. The DNA may also be any of genomic DNA, genomic DNA library, cDNA derived from the cells and tissues described above, cDNA library derived from the cells and tissues described above and synthetic DNA. The vector to be used for the library may be any of bacteriophage, plasmid, cosmid and phagemid. The DNA may also be directly amplified by reverse transcriptase polymerase chain reaction (hereinafter abbreviated as RT-PCR) using mRNA fraction prepared from the cells and tissues described above.

Specifically, the DNA encoding the partial peptide of the present invention may be any one of, for example, (1) a DNA containing a partial base sequence of the DNA having the base sequence represented by SEQ ID NO: 2 or (2) any DNA containing a partial base sequence of the DNA having a base sequence hybridizable to the base sequence represented by SEQ ID NO: 2 under highly stringent conditions and encoding the receptor protein which has the activities substantially equivalent to those of GPR39 (e.g., a ligand-binding activity, signal transduction activity, cytokine (e.g., IL-8) secretion-promoting activity, etc.); etc.

Examples of the DNA that is hybridizable to the base sequence represented by SEQ ID NO: 2 include DNA comprising a base sequence having at least about 80% homology, preferably at least about 90% homology and more preferably at least about 95% homology, to the base sequence represented by SEQ ID NO: 2.

Homology in the amino acid sequence can be measured under the same conditions using the homology scoring algorithm NCBI BLAST described above.

The method and conditions of the hybridization is same to the described above.

For cloning of the DNA that completely encodes GPR39 or its partial peptide (hereinafter sometimes collectively referred to as GPR39), the DNA may be amplified by PCR using synthetic DNA primers containing a part of the base sequence of DNA encoding GPR39, or the DNA inserted into an appropriate vector can be selected by hybridization with a labeled DNA fragment or synthetic DNA that encodes a part or entire region of GPR39. The hybridization can be carried out, for example, according to the method described in Molecular Cloning, 2nd, J. Sambrook et al., Cold Spring Harbor Lab. Press, 1989. The hybridization may also be performed using commercially available library in accordance with the protocol described in the attached instructions.

Conversion of the base sequence of the DNA can be effected by publicly known methods such as the ODA-LA PCR method, the Gapped duplex method or the Kunkel method or its modification by using a publicly known kit available as Mutan<sup>TM</sup>-superExpressKm (manufactured by Takara Shuzo Co., Ltd.), Mutan<sup>TM</sup>-K (manufactured by TaKaRa Shuzo Co., Ltd.), etc.

The cloned DNA encoding GPR39 can be used as it is, depending upon purpose or, if desired, after digestion with a restriction enzyme or after the addition of a linker thereto. The DNA may contain ATG as a translation initiation codon at the 5' end thereof and may further contain TAA, TGA or TAG as a translation termination codon at the 3' end thereof. These translation initiation and termination codons may also be added by using an appropriate synthetic DNA adapter.

The expression vector for GPR39 can be manufactured, for example, by (a) excising the desired DNA fragment from the DNA encoding GPR39, and then (b) ligating the DNA fragment with an appropriate expression vector downstream a promoter in the vector.

Examples of the vector include plasmids derived from *E. coli* (e.g., pBR322, pBR325, pUC12, pUC13), plasmids derived from *Bacillus subtilis* (e.g., pUB110, pTP5, pC194), plasmids derived from yeast (e.g., pSH19, pSH15), bacteriophages such as  $\lambda$  phage, etc., animal viruses such as retrovirus, vaccinia virus, baculovirus, etc. as well as pA1-11, pXT1, pRc/CMV, pRc/RSV, pcDNAI/Neo, etc.

The promoter used in the present invention may be any promoter if it matches well with a host to be used for gene expression. In the case of using animal cells as the host, examples of the promoter include SR $\alpha$  promoter, SV40 promoter,

LTR promoter, CMV promoter, HSV-TK promoter, etc.

Among them, CMV promoter or SR $\alpha$  promoter is preferably used. Where the host is bacteria of the genus *Escherichia*, preferred examples of the promoter include trp promoter, lac promoter, recA promoter,  $\lambda$ P<sub>L</sub> promoter, lpp promoter, etc.

5 In the case of using bacteria of the genus *Bacillus* as the host, preferred example of the promoter are SPO1 promoter, SPO2 promoter, penP promoter, etc. When yeast is used as the host, preferred examples of the promoter are PHO5 promoter, PGK promoter, GAP promoter, ADH promoter, etc. When insect cells are used as the host, preferred examples of the promoter include polyhedrin promoter, P10 promoter, etc.

10 In addition to the foregoing examples, the expression vector may further optionally contain an enhancer, a splicing signal, a polyA addition signal, a selection marker, SV40 replication origin (hereinafter sometimes abbreviated as SV40ori) etc. Examples of the selection marker include dihydrofolate reductase (hereinafter sometimes abbreviated as dhfr) gene [methotrexate (MTX) resistance], ampicillin  
15 resistant gene (hereinafter sometimes abbreviated as Amp<sup>r</sup>), neomycin resistant gene (hereinafter sometimes abbreviated as Neo<sup>r</sup>, G418 resistance), etc. In particular, when dhfr gene is used as the selection marker in CHO (dhfr<sup>-</sup>) cells, selection can also be made on thymidine free media.

If necessary, a signal sequence that matches with a host is added to the  
20 N-terminus of the receptor protein of the present invention. Examples of the signal sequence that can be used are Pho A signal sequence, OmpA signal sequence, etc. in the case of using bacteria of the genus *Escherichia* as the host;  $\alpha$ -amylase signal sequence, subtilisin signal sequence, etc. in the case of using bacteria of the genus *Bacillus* as the host; MF $\alpha$  signal sequence, SUC2 signal sequence, etc. in the case of  
25 using yeast as the host; and insulin signal sequence,  $\alpha$ -interferon signal sequence, antibody molecule signal sequence, etc. in the case of using animal cells as the host, respectively.

Using the vector containing the DNA encoding GPR39 thus constructed, transformants can be manufactured.

30 Examples of the host, which may be employed, are bacteria belonging to the genus *Escherichia*, bacteria belonging to the genus *Bacillus*, yeast, insect cells, insects and animal cells, etc.

Specific examples of the bacteria belonging to the genus *Escherichia* include *Escherichia coli* K12 DH1 [Proc. Natl. Acad. Sci. U.S.A., 60, 160 (1968)], JM103  
35 (Nucleic Acids Research, 9, 309 (1981)], JA221 [Journal of Molecular Biology, 120,

517 (1978)], HB101 [Journal of Molecular Biology, 41, 459 (1969)], C600 (Genetics, 39, 440 (1954)], etc.

Examples of the bacteria belonging to the genus *Bacillus* include *Bacillus subtilis* MI114 [Gene, 24, 255 (1983)], 207-21 [Journal of Biochemistry, 95, 87 (1984)], etc.

Examples of yeast include *Saccharomyces cerevisiae* AH22, AH22R<sup>+</sup>, NA87-11A, DKD-5D, 20B-12, *Schizosaccharomyces pombe* NCYC1913, NCYC2036, *Pichia pastoris*, etc.

Examples of insect cells include, for the virus AcNPV, *Spodoptera frugiperda* cells (Sf cells), MG1 cells derived from mid-intestine of *Trichoplusia ni*, High Five<sup>TM</sup> cells derived from egg of *Trichoplusia ni*, cells derived from *Mamestra brassicae*, cells derived from *Estigmena acrea*, etc.; and for the virus BmNPV, *Bombyx mori* N cells (BmN cells), etc. are used. Examples of the Sf cell which can be used are Sf9 cells (ATCC CRL1711) and Sf21 cells (both cells are described in Vaughn, J. L. et al., *In Vivo*, 13, 213-217 (1977)).

As the insect, for example, a larva of *Bombyx mori* can be used [Maeda, et al., *Nature*, 315, 592 (1985)].

Examples of animal cells include monkey cells COS-7, Vero, Chinese hamster cells CHO (hereinafter referred to as CHO cells), dhfr gene deficient Chinese hamster cells CHO (hereinafter simply referred to as CHO(dhfr<sup>-</sup>) cell), mouse L cells, mouse AtT-20, mouse myeloma cells, rat GH3, human FL cells, etc.

Bacteria belonging to the genus *Escherichia* can be transformed, for example, by the method described in *Proc. Natl. Acad. Sci. U.S.A.*, 69, 2110 (1972), *Gene*, 17, 107 (1982), etc.

Bacteria belonging to the genus *Bacillus* can be transformed, for example, by the method described in *Molecular & General Genetics*, 168, 111 (1979).

Yeast can be transformed, for example, by the method described in *Methods in Enzymology*, 194, 182-187 (1991), *Proc. Natl. Acad. Sci. U.S.A.*, 75, 1929 (1978), etc.

Insect cells or insects can be transformed, for example, according to the method described in *Bio/Technology*, 6, 47-55(1988), etc.

Animal cells can be transformed, for example, according to the method described in *Saibo Kogaku* (Cell Engineering), extra issue 8, *Shin Saibo Kogaku Jikken Protocol* (New Cell Engineering Experimental Protocol), 263-267 (1995), published by Shujunsha, or *Virology*, 52, 456 (1973).

Thus, the transformant transformed with the expression vector containing the DNA encoding GPR39 can be obtained.

Where the host is bacteria belonging to the genus *Escherichia* or the genus *Bacillus*, the transformant can be appropriately incubated in a liquid medium which contains materials required for growth of the transformant such as carbon sources, nitrogen sources, inorganic materials, and so on. Examples of the carbon sources include glucose, dextrin, soluble starch, sucrose, etc. Examples of the nitrogen sources include inorganic or organic materials such as ammonium salts, nitrate salts, corn steep liquor, peptone, casein, meat extract, soybean cake, potato extract, etc. Examples of the inorganic materials are calcium chloride, sodium dihydrogenphosphate, magnesium chloride, etc. In addition, yeast extract, vitamins, growth promoting factors etc. may also be added to the medium. Preferably, pH of the medium is adjusted to about 5 to about 8.

A preferred example of the medium for incubation of the bacteria belonging to the genus *Escherichia* is M9 medium supplemented with glucose and Casamino acids (Miller, Journal of Experiments in Molecular Genetics, 431-433, Cold Spring Harbor Laboratory, New York, 1972). If necessary, a chemical such as 3 $\beta$ -indolylacrylic acid can be added to the medium thereby to activate the promoter efficiently.

Where the bacteria belonging to the genus *Escherichia* are used as the host, the transformant is usually cultivated at about 15 to 43°C for about 3 hours to about 24 hours. If necessary, the culture may be aerated or agitated.

Where the bacteria belonging to the genus *Bacillus* are used as the host, the transformant is cultivated generally at about 30 to 40°C for about 6 to 24 hours. If necessary, the culture can be aerated or agitated.

Where yeast is used as the host, the transformant is cultivated, for example, in Burkholder's minimal medium [Bostian, K. L. et al., Proc. Natl. Acad. Sci. U.S.A., 77, 4505 (1980)] or in SD medium supplemented with 0.5% Casamino acids [Bitter, G. A. et al., Proc. Natl. Acad. Sci. U.S.A., 81, 5330 (1984)]. Preferably, pH of the medium is adjusted to about 5 to about 8. In general, the transformant is cultivated at about 20°C to about 35°C for about 24 to 72 hours. If necessary, the culture can be aerated or agitated.

Where insect cells or insects are used as the host, the transformant is cultivated in, for example, Grace's Insect Medium (Grace, T. C. C., Nature, 195, 788 (1962)) to which an appropriate additive such as immobilized 10% bovine serum is

added. Preferably, pH of the medium is adjusted to about 6.2 to about 6.4. Normally, the transformant is cultivated at about 27°C for about 3 days to about 5 days and, if necessary and desired, the culture can be aerated or agitated.

Where animal cells are employed as the host, the transformant is cultivated  
5 in, for example, MEM medium containing about 5% to about 20% fetal bovine serum [Science, 122, 501 (1952)], DMEM medium [Virology, 8, 396 (1959)], RPMI 1640 medium [The Journal of the American Medical Association, 199, 519 (1967)], 199 medium [Proceeding of the Society for the Biological Medicine, 73, 1 (1950)], etc. Preferably, pH of the medium is adjusted to about 6 to about 8. The transformant  
10 is usually cultivated at about 30°C to about 40°C for about 15 hours to about 60 hours and, if necessary and desired, the culture can be aerated or agitated.

As described above, GPR39 can be produced into the cell, in the cell membrane or out of the cell of the transformant.

GPR39 can be separated and purified from the culture described above by  
15 the following procedures.

When GPR39 is extracted from the culture or cells, after cultivation the transformants or cells are collected by a publicly known method and suspended in an appropriate buffer. The transformants or cells are then disrupted by publicly known methods such as ultrasonication, a treatment with lysozyme and/or freeze-thaw  
20 cycling, followed by centrifugation, filtration, etc. Thus, the crude extract of GPR39 can be obtained. The buffer used for the procedures may contain a protein modifier such as urea or guanidine hydrochloride, or a surfactant such as Triton X-100<sup>TM</sup>, etc. When GPR39 is secreted in the culture, after completion of the cultivation the supernatant can be separated from the transformants or cells to collect the  
25 supernatant by a publicly known method.

GPR39 contained in the supernatant or the extract thus obtained can be purified by appropriately combining the publicly known methods for separation and purification. Such publicly known methods for separation and purification include a method utilizing difference in solubility such as salting out, solvent precipitation,  
30 etc.; a method utilizing mainly difference in molecular weight such as dialysis, ultrafiltration, gel filtration, SDS-polyacrylamide gel electrophoresis, etc.; a method utilizing difference in electric charge such as ion exchange chromatography, etc.; a method utilizing difference in specific affinity such as affinity chromatography, etc.; a method utilizing difference in hydrophobicity such as reverse phase high  
35 performance liquid chromatography, etc.; a method utilizing difference in isoelectric

point such as isoelectrofocusing electrophoresis; and the like.

In the case that GPR39 thus obtained is in a free form, it can be converted into the salt by publicly known methods or modifications thereof. On the other hand, when GPR39 is obtained in the form of a salt, it can be converted into the free form  
5 or in the form of a different salt by publicly known methods or modifications thereof.

GPR39 produced by the recombinant can be treated, prior to or after the purification, with an appropriate protein modifying enzyme so that GPR39 can be appropriately modified to partially remove a polypeptide. Examples of the protein-modifying enzyme include trypsin, chymotrypsin, arginyl endopeptidase,  
10 protein kinase, glycosidase or the like.

The activity of the thus produced GPR39 can be determined by a binding experiment to a labeled ligand, by an enzyme immunoassay using a specific antibody, or the like.

Antibodies to GPR39 may be any of polyclonal antibodies and monoclonal  
15 antibodies, as long as they are capable of recognizing GPR39.

The antibodies to GPR39 may be manufactured by publicly known methods for manufacturing antibodies or antisera, using as antigens GPR39.

#### [Preparation of monoclonal antibody]

##### 20 (a) Preparation of monoclonal antibody-producing cells

GPR39 is administered to mammals either solely or together with carriers or diluents to the site where the production of antibody is possible by the administration. In order to potentiate the antibody productivity upon the administration, complete Freund's adjuvants or incomplete Freund's adjuvants may be administered. The  
25 administration is usually carried out once in every two to six weeks and 2 to 10 times in total. Examples of the applicable mammals are monkeys, rabbits, dogs, guinea pigs, mice, rats, sheep and goats, with mice and rats being preferred.

In the preparation of monoclonal antibody-producing cells, warm-blooded animals, e.g., mice, immunized with an antigen wherein the antibody titer is noted is  
30 selected, then the spleen or lymph node is collected after 2 to 5 days from the final immunization and antibody-producing cells contained therein are fused with myeloma cells to give monoclonal antibody-producing hybridomas. Measurement of the antibody titer in antisera may be made, for example, by reacting a labeled form of the receptor protein, which will be described later, with the antiserum followed by  
35 assaying the binding activity of the labeling agent bound to the antibody. The fusion

may be operated, for example, by the known Koehler and Milstein method [Nature, 256, 495 (1975)]. Examples of the fusion accelerator are polyethylene glycol (PEG), Sendai virus, etc., of which PEG is preferably employed.

Examples of the myeloma cells are NS-1, P3U1, SP2/0, etc. In particular,  
 5 P3U1 is preferably employed. A preferred ratio of the count of the antibody-producing cells used (spleen cells) to the count of myeloma cells is within a range of approximately 1:1 to 20:1. When PEG (preferably, PEG 1000 to PEG 6000) is added in a concentration of approximately 10 to 80% followed by incubating at about 20 to about 40°C, preferably at about 30 to about 37°C for about 1 to about 10  
 10 minutes, an efficient cell fusion can be carried out.

Various methods can be used for screening of a monoclonal antibody-producing hybridoma. Examples of such methods include a method which comprises adding the supernatant of hybridoma to a solid phase (e.g., microplate) adsorbed with an antigen of the receptor protein directly or together with a carrier,  
 15 adding an anti-immunoglobulin antibody (when mouse cells are used for the cell fusion, anti-mouse immunoglobulin antibody is used) labeled with a radioactive substance or an enzyme, or Protein A and detecting the monoclonal antibody bound to the solid phase, and a method which comprises adding the supernatant of hybridoma to a solid phase adsorbed with an anti-immunoglobulin antibody or  
 20 Protein A, adding the receptor protein labeled with a radioactive substance or an enzyme and detecting the monoclonal antibody bound to the solid phase.

The monoclonal antibody can be selected by publicly known methods or by modifications of these methods. In general, the selection can be effected in a medium for animal cells supplemented with HAT (hypoxanthine, aminopterin and thymidine).  
 25 Any selection and growth medium can be employed as far as the hybridoma can grow therein. For example, RPMI 1640 medium containing 1% to 20%, preferably 10% to 20% fetal bovine serum, GIT medium (Wako Pure Chemical Industries, Ltd.) containing 1% to 10% fetal bovine serum, a serum free medium for cultivation of a hybridoma (SFM-101, Nissui Seiyaku Co., Ltd.) and the like can be used for the  
 30 selection and growth medium. The cultivation is carried out generally at 20°C to 40°C, preferably at about 37°C, for 5 days to 3 weeks, preferably 1 to 2 weeks. The cultivation can be conducted normally in 5% CO<sub>2</sub>. The antibody titer of the culture supernatant of hybridomas can be determined as in the assay for the antibody titer in antisera described above.

35 (b) Purification of monoclonal antibody

Separation and purification of a monoclonal antibody can be carried out by methods applied to conventional separation and purification of immunoglobulins, as in the conventional methods for separation and purification of polyclonal antibodies [e.g., salting-out, alcohol precipitation, isoelectric point precipitation, electrophoresis, adsorption and desorption with ion exchangers (e.g., DEAE), ultracentrifugation, gel filtration, or a specific purification method which comprises collecting only an antibody with an activated adsorbent such as an antigen-binding solid phase, Protein A, Protein G, etc. and dissociating the binding to obtain the antibody].

[Preparation of polyclonal antibody]

The polyclonal antibody of the present invention can be manufactured by publicly known methods or modifications thereof. For example, a complex of immunogen (GPR39 antigen) and a carrier protein is prepared, and a mammal is immunized with the complex in a manner similar to the method described above for the manufacture of monoclonal antibodies. The product containing the antibody to GPR39 is collected from the immunized animal followed by separation and purification of the antibody.

In the complex of an immunogen and a carrier protein used to immunize a mammal, the type of carrier protein and the mixing ratio of a carrier to hapten may be any type and in any ratio, as long as the antibody is efficiently produced to the hapten immunized by crosslinking to the carrier. For example, bovine serum albumin, bovine thyroglobulins, keyhole limpet hemocyanin, etc. is coupled to hapten in a carrier-to-hapten weight ratio of approximately 0.1 to 20, preferably about 1 to about 5.

A variety of condensing agents can be used for the coupling of a carrier to hapten. Glutaraldehyde, carbodiimide, maleimide activated ester, activated ester reagents containing thiol group or dithiopyridyl group, etc. are used for the coupling.

The condensation product is administered to warm-blooded animals either solely or together with carriers or diluents to the site in which the antibody can be produced by the administration. In order to potentiate the antibody productivity upon the administration, complete Freund's adjuvant or incomplete Freund's adjuvant may be administered. The administration is usually made once approximately in every 2 to 6 weeks and about 3 to about 10 times in total.

The polyclonal antibody can be collected from the blood, ascites, etc., preferably from the blood of mammals immunized by the method described above.

The polyclonal antibody titer in antiserum can be assayed by the same

procedure as that for the determination of serum antibody titer described above. The separation and purification of the polyclonal antibody can be carried out, following the method for the separation and purification of immunoglobulins performed as applied to the separation and purification of monoclonal antibodies described hereinabove.

The ligand for GPR39 is an ionizable metal element or salts thereof.

Examples of the ionizable metal element include zinc, copper, nickel, cadmium, and so on.

As salts of these metal elements, for example, salts with acids such as hydrochloric acid, sulfuric acid, nitric acid, acetic acid, etc., specifically preferred are cadmium chloride, zinc chloride, zinc acetate, copper chloride, copper sulfate, nickel chloride and nickel sulfate, etc. are used and more preferred are cadmium chloride, zinc chloride, copper chloride and nickel chloride.

In the present specification, the ionizable metal elements include (1) metal elements in an ionic state (e.g., zinc ions, copper ions, nickel ions and cadmium ions); (2) compounds containing the ionizable metal elements (e.g., oxides such as zinc oxide, copper oxide, nickel oxide and cadmium oxide), and the like.

Hereinafter, the ionizable metal elements such as cadmium, zinc, copper, nickel, etc., or salts thereof are merely referred to as the "metal elements" throughout the specification.

GPR39, the DNA encoding GPR39 (hereinafter sometimes referred to briefly as the DNA of the present invention), the antibody to GPR39 (hereinafter sometimes referred to briefly as the antibody of the present invention) and the antisense DNA to the DNA of the present invention (hereinafter sometimes referred to briefly as the antisense DNA of the present invention) have the following applications.

(1) Agent for preventing/treating diseases associated with dysfunction of GPR39

a) GPR39 or b) the DNA encoding GPR39 can be used as pharmaceutical drugs such as agents for preventing/treating diseases associated with dysfunction of GPR39, etc.

For example, when the physiological activities of the metal element as the ligand cannot be expected in a patient (deficiency of GPR39) due to a decrease of GPR39 in the body, the amount of GPR39 can be increased in the body of the patient a) by administering GPR39 to the patient thereby to supplement the amount of GPR39; or b) (a) by administering the DNA encoding GPR39 to the patient to

express the same, or (ii) by inserting and expressing the DNA encoding GPR39 in the objective cells and then transplanting the cells to the patient, whereby the activities of the ligand can be sufficiently exhibited. That is, the DNA encoding GPR39 is useful as a safe and low toxic agent for preventing/treating diseases associated with dysfunction of GPR39.

Specifically, GPR39 or the DNA of the present invention can be used as a prophylactic/therapeutic agent for metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc., or an agent for promoting the secretion of cytokines (e.g., IL-8).

Where GPR39 is used as the preventive/therapeutic agent described above, GPR39 can be prepared into a pharmaceutical composition in a conventional manner.

On the other hand, where the DNA of the present invention is used as the preventive/therapeutic agent described above, the DNA itself is administered alone; alternatively, the DNA is inserted into an appropriate vector such as retrovirus vector, adenovirus vector, adenovirus-associated virus vector, etc. and then administered in a conventional manner. The DNA of the present invention may also be administered as naked DNA, or with adjuvants to assist its uptake by gene gun or through a catheter such as a catheter with a hydrogel.

For example, a) GPR39 or b) the DNA of the present invention can be used orally, for example, in the form of tablets which may be sugar coated if necessary, capsules, elixirs, microcapsules etc., or parenterally in the form of injectable preparations such as a sterile solution and a suspension in water or with other pharmaceutically acceptable liquid. These preparations can be manufactured by mixing a) GPR39 or b) the DNA of the present invention with a physiologically acceptable known carrier, a flavoring agent, an excipient, a vehicle, an antiseptic agent, a stabilizer, a binder, etc. in a unit dosage form required in a generally accepted manner that is applied to making pharmaceutical preparations. The effective component in the preparation is controlled in such a dose that an appropriate dose is

obtained within the specified range given.

Additives miscible with tablets, capsules, etc. include a binder such as gelatin, corn starch, tragacanth and gum arabic, an excipient such as crystalline cellulose, a puffiness agent such as corn starch, gelatin and alginic acid, a lubricant  
 5 such as magnesium stearate, a sweetening agent such as sucrose, lactose and saccharin, and a flavoring agent such as peppermint, akamono oil and cherry. When the unit dosage is in the form of capsules, liquid carriers such as oils and fats may further be used together with the additives described above. A sterile composition for injection may be formulated by conventional procedures used to make  
 10 pharmaceutical compositions, e.g., by dissolving or suspending the active ingredients in a vehicle such as water for injection with a naturally occurring vegetable oil such as sesame oil and coconut oil, etc. to prepare the pharmaceutical composition. Examples of an aqueous medium for injection include physiological saline and an isotonic solution containing glucose and other auxiliary agents (e.g., D-sorbitol,  
 15 D-mannitol, sodium chloride, etc.) and may be used in combination with an appropriate dissolution aid such as an alcohol (e.g., ethanol or the like), a polyalcohol (e.g., propylene glycol and polyethylene glycol), a nonionic surfactant (e.g., polysorbate 80<sup>TM</sup> and HCO-50), etc. Examples of the oily medium include sesame oil and soybean oil, which may also be used in combination with a dissolution aid  
 20 such as benzyl benzoate and benzyl alcohol.

The preventive/therapeutic agent described above may further be formulated with a buffer (e.g., phosphate buffer, sodium acetate buffer, etc.), a soothing agent (e.g., benzalkonium chloride, procaine hydrochloride, etc.), a stabilizer (e.g., human serum albumin, polyethylene glycol, etc.), a preservative (e.g., benzyl alcohol,  
 25 phenol, etc.), an antioxidant, etc. The thus-prepared liquid for injection is normally filled in an appropriate ampoule.

Since the thus obtained pharmaceutical preparation is safe and low toxic, the preparation can be administered to human or mammals (e.g., rats, mice, rabbits, sheep, swine, bovine, cats, dogs, monkeys, etc.).

30 The dose of GPR39 varies depending on the subject to be administered, target organ, conditions, method for administration, etc.; in oral administration for the patient (as 60 kg body weight) with, e.g., cancer, the dose is normally about 0.1 mg to about 100 mg, preferably about 1.0 to about 50 mg, and more preferably about 1.0 to about 20 mg per day. In parenteral administration, the single dose varies  
 35 depending on the subject to be administered, target organ, conditions, method for

administration, etc. but in the form of injectable preparation, it is advantageous to administer GPR39 intravenously to the patient (as 60 kg body weight) with, e.g., cancer, in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg. For other animal species, the corresponding dose as converted per 60 kg can be administered.

The dose of the DNA of the present invention varies depending on the subject to be administered, target organ, conditions, method for administration, etc.; in oral administration for the patient (as 60 kg body weight) with, e.g., cancer, the dose is normally about 0.1 mg to about 100 mg, preferably about 1.0 to about 50 mg, and more preferably about 1.0 to about 20 mg per day. In parenteral administration, the single dose varies depending on the subject to be administered, target organ, conditions, method for administration, etc. but in the form of injectable preparation, it is advantageous to administer the DNA intravenously to the patient (as 60 kg body weight) with, e.g., cancer in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg. For other animal species, the corresponding dose as converted per 60 kg can be administered.

## (2) Gene diagnostic agent

By using the DNA and antisense DNA as probes, an abnormality (gene abnormality) of the DNA or mRNA encoding GPR39 or its partial peptides in human or mammals (e.g., rats, mice, rabbits, sheep, swine, bovine, cats, dogs, monkeys, etc.) can be detected, and are thus useful as gene diagnostic agents for the damage against the DNA or mRNA, its mutation, or its reduced expression, or increased expression or overexpression of the DNA or mRNA.

The gene diagnosis described above using the DNA, antisense DNA of the present invention can be performed by, for example, the publicly known Northern hybridization assay or the PCR-SSCP assay (Genomics, 5, 874-879 (1989); Proceedings of the National Academy of Sciences of the United States of America, 86, 2766-2770 (1989)), etc.

Where a reduced expression or overexpression of GPR39 is detected by, e.g., northern hybridization, it can be diagnosed that one suffers from diseases associated with, for example, the dysfunction or excessive action of GPR39, or it is highly likely to suffer from these disease in the future.

The diseases associated with the dysfunction of GPR39 include metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution,

declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc.

The diseases caused by the excessive action of GPR39 include, for example, excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., or inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)); or the like.

(3) Pharmaceutical drug comprising a compound or its salt that changes the expression level of GPR39

By using the DNA of the present invention as a probe, the DNA can be used for screening a compound or its salt that changes the expression level of GPR39.

That is, the present invention provides methods of screening the compound or its salt that changes the expression level of GPR39, which comprises measuring the amount of mRNA in GPR39 contained in, for example, (i) a) blood, b) particular organs, c) tissues or cells isolated from the organs of non-human mammal or in (ii) transformants, etc.

Specifically, the amount of mRNA in GPR39 can be measured as follows.

(i) Normal or disease models of non-human mammals (e.g., mice, rats, rabbits, sheep, swine, bovine, cats, dogs, monkeys, more specifically, immunodeficiency model rats, mice, rabbits, etc.) receive a drug (e.g., an immunomodulator, etc.) or physical stress (e.g., soaking stress, electric shock, light and darkness, low temperature, etc.), and the blood, particular organs (e.g., brain,

liver, kidney, etc.), or tissues or cells isolated from the organs are obtained after a specified period of time.

The mRNA of GPR39 contained in the thus obtained cells is extracted from the cells, for example, in a conventional manner and quantified by means of, e.g.,  
5 TaqManPCR, or may also be analyzed by northern blot technique by publicly known methods.

(ii) Transformants that express GPR39 are prepared according to the methods described above, and the mRNA of GPR39 can be quantified and analyzed, as described above.

10 The compound that changes the expression level of GPR39 can be screened by the following procedures.

(i) To a normal or disease model of non-human mammal, a test compound is administered at a specified period of time before (30 minutes to 24 hours before, preferably 30 minutes to 12 hours before, more preferably 1 hour to 6 hours before),  
15 at a specified time after (30 minutes to 3 days after, preferably 1 hour to 2 days after, more preferably 1 hour to 24 hours after), or simultaneously with a drug or physical stress. At a specified time (30 minute to 3 days, preferably 1 hour to 2 days, more preferably 1 hour to 24 hours) after administration of the test compound, the amount of mRNA in GPR39 contained in cells are quantified and analyzed.

20 (ii) Transformants are cultured in a conventional manner and a test compound is mixed in the culture medium. After a specified time (after 1 day to 7 days, preferably after 1 day to 3 days, more preferably after 2 to 3 days), the amount of mRNA in GPR39 contained in the transformants can be quantified and analyzed.

The test compounds include peptides, proteins, non-peptide compounds,  
25 synthetic compounds, fermentation products, cell extracts, plant extracts, animal tissue extracts, blood plasma, etc. They may be novel or known compounds.

The test compound may form salts and may be used in the form of salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.), preferably physiologically acceptable acid addition salts. Examples of  
30 such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

35 The compound, which is obtained by the screening methods of the present

invention, is the compound that changes the expression level of GPR39. Specifically, it is (a) the compound that potentiates the cell stimulating activities mediated by GPR39 (e.g., the activities that promote or suppress arachidonic acid release, acetylcholine release, intracellular  $\text{Ca}^{2+}$  release, intracellular cAMP production, intracellular cGMP production, inositol phosphate production, alters in cell membrane potential, phosphorylation of intracellular proteins, activation of c-fos, pH reduction, etc.; an action of promoting the secretion of cytokines (e.g., IL-8), etc.; in particular, the intracellular  $\text{Ca}^{2+}$  level increasing activity (intracellular  $\text{Ca}^{2+}$  release activity), action of promoting the secretion of cytokines (e.g., IL-8)) by increasing the expression level of GPR39; and (b) the compound that attenuates the cell-stimulating activities by reducing the expression level of GPR39.

The compounds obtained by using the screening method of the present invention include peptides, proteins, non-peptide compounds, synthetic compounds, fermentation products, etc. They may be novel or known compounds.

As salts of the compound obtained by the screening method of the present invention, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

The ligand for GPR39 is the ionizable metal element such as cadmium, zinc, copper and nickel, or salts thereof.

Thus, the compound or its salts, which are obtained by the screening method described above and change the expression level of GPR39, can be used as a prophylactic/therapeutic agent for diseases associated with the dysfunction of GPR39 (for example, metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by

postsurgical bladder anesthesia of the pelvic organs; etc.), or diseases associated with the excessive action of GPR39 (for example, excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc.), an agent for regulating the secretion of cytokines (e.g., IL-8), or inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), and so on.

Specifically, the compound or its salts that increase the expression level of GPR39 can be used as a prophylactic/therapeutic agent for, for example, metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc., or as an agent for promoting the secretion of cytokines (e.g., IL-8).

On the other hand, the compound or its salts that decrease the expression level of GPR39 can be used as a prophylactic/therapeutic agent for, for example, excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel

syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), and the like.

Where the compound or its salt, which is obtained by the screening methods of the present invention, is used as a pharmaceutical composition, the compound or  
5 its salt can be prepared into a pharmaceutical preparation in a conventional manner.

For example, the compound can be used orally in the form of tablets which may be tablets, if necessary, coated with sugar, capsules, elixirs, microcapsules, etc., or parenterally in the form of injectable preparations such as a sterile solution or a suspension in water or with other pharmaceutically acceptable liquid. These  
10 preparations can be manufactured, e.g., by mixing the compound, with a physiologically acceptable known carrier, flavoring agent, excipient, vehicle, antiseptic, stabilizer, binder, etc., in a unit dosage form required in a generally accepted manner applied to making pharmaceutical preparations. The active ingredient in the preparation is controlled in such an amount that an appropriate dose  
15 is obtained within the specified range given.

Additives miscible with tablets, capsules, etc. include a binder such as gelatin, corn starch, tragacanth or gum arabic, an excipient such as crystalline cellulose, a puffiness agent such as corn starch, gelatin, alginic acid, etc., a lubricant such as magnesium stearate, a sweetening agent such as sucrose, lactose or saccharin,  
20 a flavoring agent such as peppermint, akamono oil or cherry, and the like. When the unit dosage is in the form of capsules, liquid carriers such as oils and fats may further be used together with the additives described above. A sterile composition for injection may be formulated following a conventional manner used to make pharmaceutical compositions, e.g., by dissolving or suspending the active ingredients  
25 in a vehicle such as water for injection with a naturally occurring vegetable oil such as sesame oil, coconut oil, etc. to prepare the pharmaceutical composition. Examples of an aqueous medium for injection include physiological saline, an isotonic solution containing glucose and other auxiliary agents (e.g., D-sorbitol, D-mannitol, sodium chloride, etc.) or the like, which may be used in combination with an appropriate  
30 dissolution aid such as an alcohol (e.g., ethanol), a polyalcohol (e.g., propylene glycol, polyethylene glycol), a nonionic surfactant (e.g., polysorbate 80<sup>TM</sup> and HCO-50), etc. As an oily medium, for example, sesame oil, soybean oil or the like may be used, which can be used in combination with a dissolution aid such as benzyl benzoate, benzyl alcohol, etc.

35 Furthermore, the preventive/therapeutic agent described above may also be

formulated with a buffer (e.g., phosphate buffer, sodium acetate buffer), a soothing agent (e.g., benzalkonium chloride, procaine hydrochloride, etc.), a stabilizer (e.g., human serum albumin, polyethylene glycol, etc.), a preservative (e.g., benzyl alcohol, phenol, etc.), an antioxidant, etc. The thus prepared liquid for injection is normally  
5 filled in an appropriate ampoule.

Since the thus obtained pharmaceutical preparation is safe and low toxic, the preparation can be administered to human or mammal (e.g., rats, mice, rabbits, sheep, swine, bovine, cats, dogs, monkeys, etc.).

The dose of the compound or its salt varies depending on the subject to be  
10 administered, target organ, conditions, method for administration, etc.; in oral administration for the patient (as 60 kg body weight) with, e.g., cancer, the dose of the compound or its salt that increases the expression level of GPR39 is normally about 0.1 mg to about 100 mg, preferably about 1.0 to about 50 mg, and more preferably about 1.0 to about 20 mg per day. In parenteral administration, the single  
15 dose varies depending on the subject to be administered, target organ, conditions, method for administration, etc. but in the form of injectable preparation, it is advantageous to administer the compound or its salt intravenously to the patient (as 60 kg body weight) with, e.g., cancer in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg.  
20 For other animal species, the corresponding dose as converted per 60 kg can be administered.

#### (4) Method for diagnosis using the antibody of the present invention

The antibody of the present invention is capable of specifically recognizing  
25 GPR39. Therefore, the antibody can be used to detect or neutralize GPR39 in a test fluid.

That is, the present invention provides, for example, the following quantification methods:

(i) a method for quantification of GPR39 in a test fluid, which comprises  
30 competitively reacting the antibody of the present invention with the test fluid and a labeled form of GPR39, and measuring a ratio of the labeled GPR39 bound to the antibody; and,

(ii) a method for quantification of GPR39 in a test fluid, which comprises reacting the test fluid with the antibody of the present invention immobilized on a  
35 carrier and a labeled form of the antibody of the present invention simultaneously or

sequentially, and measuring the activity of the label on the immobilized carrier.

In the quantification method (ii) described above, it is preferred that one antibody recognizes the N-terminal region of GPR39, and another antibody reacts with the C-terminal region of GPR39.

5        Using the monoclonal antibodies to GPR39, GPR39 can be assayed and in addition, can be detected by tissue staining or the like. For this purpose, the antibody molecule itself may be used, or F(ab')<sub>2</sub>, Fab' or Fab fractions of the antibody molecule may also be used.

10        The quantification methods of GPR39 using the antibodies are not particularly limited. Any quantification method can be used, so long as the amount of antibody, antigen, or antibody-antigen complex corresponding to the amount of antigen (e.g., the amount of GPR39) in the test fluid can be detected by chemical or physical means and the amount of the antigen can be calculated from a standard curve prepared from standard solutions containing known amounts of the antigen.

15        For example, nephrometry, competitive methods, immunometric method, and sandwich method are appropriately used, with the sandwich method described below being most preferable in terms of sensitivity and specificity.

20        As the labeling agent for the methods using labeled substances, there are employed, for example, radioisotopes, enzymes, fluorescent substances, luminescent substances, etc. For the radioisotope, for example, [<sup>125</sup>I], [<sup>131</sup>I], [<sup>3</sup>H], [<sup>14</sup>C] and the like are used. As the enzyme described above, stable enzymes with high specific activity are preferred; for example,  $\beta$ -galactosidase,  $\beta$ -glucosidase, alkaline phosphatase, peroxidase, malate dehydrogenase and the like are used. Examples of the fluorescent substance used are fluorescamine and fluorescein isothiocyanate are

25        used. For the luminescent substance, there are used, for example, luminol, luminol derivatives, luciferin, and lucigenin. Furthermore, the biotin-avidin system may be used for binding antibody or antigen to the label.

30        For immobilization of antigen or antibody, physical adsorption may be used. Chemical binding methods conventionally used for insolubilization or immobilization of GPR39, enzymes or the like may also be used. For the carrier, for example, insoluble polysaccharides such as agarose, dextran, cellulose, etc.; synthetic resin such as polystyrene, polyacrylamide, silicon, etc., and glass or the like are used.

35        In the sandwich method, the immobilized monoclonal antibody of the present invention is reacted with a test fluid (primary reaction), then with the labeled

monoclonal antibody of the present invention (secondary reaction), and the activity of the label on the immobilizing carrier is measured, whereby the amount of GPR39 in the test fluid can be quantified. The order of the primary and secondary reactions may be reversed, and the reactions may be performed simultaneously or with an interval. The methods of labeling and immobilization can be performed by the methods described above. In the immunoassay by the sandwich method, the antibody used for immobilized or labeled antibodies is not necessarily one species, but a mixture of two or more species of antibody may be used to increase the measurement sensitivity.

In the methods of assaying GPR39 by the sandwich method, antibodies that bind to different sites of GPR39 are preferably used as the monoclonal antibodies of the present invention for the primary and secondary reactions. That is, in the antibodies used for the primary and secondary reactions are, for example, when the antibody used in the secondary reaction recognizes the C-terminal region of GPR39, it is preferable to use the antibody recognizing the region other than the C-terminal region for the primary reaction, e.g., the antibody recognizing the N-terminal region.

The monoclonal antibodies of the present invention can be used for the assay systems other than the sandwich method, for example, competitive method, immunometric method, nephrometry, etc.

In the competitive method, antigen in a test fluid and the labeled antigen are competitively reacted with antibody, and the unreacted labeled antigen (F) and the labeled antigen bound to the antibody (B) are separated (B/F separation). The amount of the label in B or F is measured, and the amount of the antigen in the test fluid is quantified. This reaction method includes a liquid phase method using a soluble antibody as an antibody, polyethylene glycol for B/F separation and a secondary antibody to the soluble antibody, and an immobilized method either using an immobilized antibody as the primary antibody, or using a soluble antibody as the primary antibody and immobilized antibody as the secondary antibody.

In the immunometric method, antigen in a test fluid and immobilized antigen are competitively reacted with a definite amount of labeled antibody, the immobilized phase is separated from the liquid phase, or antigen in a test fluid and an excess amount of labeled antibody are reacted, immobilized antigen is then added to bind the unreacted labeled antibody to the immobilized phase, and the immobilized phase is separated from the liquid phase. Then, the amount of the label in either phase is measured to quantify the antigen in the test fluid.

In the nephrometry, insoluble precipitate produced after the antigen-antibody reaction in gel or solution is quantified. When the amount of antigen in the test fluid is small and only a small amount of precipitate is obtained, laser nephrometry using scattering of laser is advantageously employed.

5 For applying these immunological methods to the measurement methods of the present invention, any particular conditions or procedures are not required. Systems for measuring GPR39 are constructed by adding the usual technical consideration in the art to the conventional conditions and procedures. For the details of these general technical means, reference can be made to the following reviews and  
10 texts.

For example, Hiroshi Irie, ed. "Radioimmunoassay" (Kodansha, published in 1974), Hiroshi Irie, ed. "Sequel to the Radioimmunoassay" (Kodansha, published in 1979), Eiji Ishikawa, et al. ed. "Enzyme immunoassay" (Igakushoin, published in 1978), Eiji Ishikawa, et al. ed. "Immunoenzyme assay" (2nd ed.) (Igakushoin,  
15 published in 1982), Eiji Ishikawa, et al. ed. "Immunoenzyme assay" (3rd ed.) (Igakushoin, published in 1987), Methods in ENZYMOLOGY, Vol. 70 (Immunochemical Techniques (Part A)), *ibid.*, Vol. 73 (Immunochemical Techniques (Part B)), *ibid.*, Vol. 74 (Immunochemical Techniques (Part C)), *ibid.*, Vol. 84 (Immunochemical Techniques (Part D: Selected Immunoassays)), *ibid.*, Vol. 92  
20 (Immunochemical Techniques (Part E: Monoclonal Antibodies and General Immunoassay Methods)), *ibid.*, Vol. 121 (Immunochemical Techniques (Part I: Hybridoma Technology and Monoclonal Antibodies)) (all published by Academic Press Publishing).

As described above, GPR39 can be quantified with high sensitivity, using  
25 the antibody of the present invention.

Where a reduction in GPR39 level is detected by quantifying GPR39 level using the antibody of the present invention, it can be diagnosed that one suffers from, for example, diseases associated with dysfunction of GPR39, or it is highly likely to suffer from these disease in the future.

30 Where an increase in the GPR39 level is detected, it can be diagnosed that one suffers from, for example, diseases caused by the excessive action of GPR39, or it is highly likely to suffer from these disease in the future.

The diseases associated with the dysfunction of GPR39 include metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution,  
35 declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic

hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, 5 menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc.

The diseases associated with the excessive action of GPR39 include, for example, excess metal-induced symptoms such as renal dysfunction, pulmonary 10 dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., or inflammatory diseases (e.g., 15 diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), etc.

## 20 (5) Method of screening the agonist for GPR39

Since the specific metal element as the ligand binds to GPR39, increased intracellular  $\text{Ca}^{2+}$  level and promoted secretion of IL-8 are observed. Thus, GPR39 is useful as a reagent for searching or determining the agonist (including a naturally occurring ligand, synthetic ligand and element) for GPR39 other than the metal 25 elements described above, using the intracellular signal as an indicator.

That is, the present invention provides a method of determining the agonist for GPR39, which comprises assaying the intracellular  $\text{Ca}^{2+}$  level increasing activity or the IL-8 secretion promoting action mediated by GPR39, when a test compound or element or a salt thereof are brought in contact with a cell containing GPR39.

30 Examples of test compounds used include publicly known ligands (for example, angiotensin, bombesin, canavanine, cholecystokinin, glutamine, serotonin, melatonin, neuropeptide Y, opioids, purines, vasopressin, oxytocin, PACAP (e.g., PACAP27, PACAP38), secretin, glucagon, calcitonin, adrenomedullin, somatostatin, GHRH, CRF, ACTH, GRP, PTH, VIP (vasoactive intestinal and related polypeptide), 35 somatostatin, dopamine, motilin, amylin, bradykinin, CGRP (calcitonin gene-related

peptide), leukotrienes, pancreastatin, prostaglandins, thromboxane, adenosine, adrenaline, the chemokine superfamily (e.g., the CXC chemokine subfamily such as IL-8, GRO $\alpha$ , GRO $\beta$ , GRO $\gamma$ , NAP-2, ENA-78, GCP-2, PF4, IP-10, Mig, PBSF/SDF-1, etc.; the CC chemokine subfamily such as MCAF/MCP-1, MCP-2, MCP-3, MCP-4, eotaxin, RANTES, MIP-1 $\alpha$ , MIP-1 $\beta$ , HCC-1, MIP-3 $\alpha$ /LARC, MIP-3 $\beta$ /ELC, I-309, TARC, MIPF-1, MIPF-2/eotaxin-2, MDC, DC-CK1/PARC, SLC, etc.; the C chemokine subfamily such as lymphotactin, etc.; the CX3C chemokine subfamily such as fractalkine, etc.), endothelin, enterogastrin, histamine, neurotensin, TRH, pancreatic polypeptide, galanin, lysophosphatidic acid (LPA), sphingosine 1 -phosphate, etc.) as well as other substances, for example, tissue extracts from human or mammal (e.g., mice, rats, swine, bovine, sheep, monkeys, etc.), cell culture supernatants, low molecular synthetic compounds, or the like. For example, the tissue extract, cell culture supernatant or the like is added to GPR39, which is fractionated while assaying the cell-stimulating activity and a single ligand can be finally obtained.

As salts of the test compound, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

As the test elements, the elements described in, e.g., the Periodic Table, preferably, metal elements are used.

Examples of the salts of the test elements include salts with acids such as hydrochloric acid, sulfuric acid, nitric acid, acetic acid, etc.

(6) Method of screening a compound or element or a salt thereof (agonist, antagonist, etc.) that changes the binding property or signal transduction of GPR39 to the metal element and a pharmaceutical comprising the compound or element or a salt thereof that changes the binding property or signal transduction of GPR39 to the metal element

Either by using GPR39, or by constructing the recombinant GPR39 expression system and using the receptor-binding assay system via the resulting

expression system, the compound (e.g., a peptide, protein, non-peptide compound, synthetic compound or fermentation product, etc.), the compound or element or salts thereof that change the binding property or signal transduction of the metal element, which is a ligand, to GPR39 can be screened efficiently.

5           Examples of such a compound or element or a salt thereof include (a) a compound or element or a salt thereof showing the cell stimulating activities mediated by GPR39 (a so-called agonist for GPR39), (b) a compound or element or a salt thereof that inhibits the cell stimulating activities (a so-called antagonist to GPR39), (c) a compound or element or a salt thereof that potentiates the binding  
10       property of the metal element to GPR39, or (d) a compound or element or a salt thereof that decreases the binding property of the metal element to GPR39, and the like.

          That is, the present invention provides a method of screening a compound or element or a salt thereof or a salt thereof that changes the binding property or signal  
15       transduction of GPR39 to the metal element, which comprises comparing the following two cases: (i) the case wherein GPR39 is brought in contact with the metal element; and (ii) the case wherein GPR39 is brought in contact with the metal element and a test compound.

          According to the screening method of the present invention, the method is  
20       characterized by assaying, e.g., the binding amount of the metal element to GPR39, the cell-stimulating activities, etc. in (i) and (ii) and comparing (i) and (ii).

          The cell-stimulating activities include the activities that promote or suppress, for example, arachidonic acid release, acetylcholine release, intracellular  $\text{Ca}^{2+}$  release (increase in intracellular  $\text{Ca}^{2+}$  level), intracellular cAMP production, intracellular  
25       cGMP production, inositol phosphate production, cell membrane potential, phosphorylation of intracellular proteins, activation of c-fos, pH reduction, etc., an action of promoting the secretion of cytokines (e.g., IL-8) from the GPR39 expression cell UM-UC-3, etc. Among them, the intracellular  $\text{Ca}^{2+}$  level increasing activity, action of promoting the secretion of cytokines (e.g., IL-8) from the GPR39  
30       expression cell UM-UC-3, etc. are preferred.

          More specifically, the present invention provides the following methods.

          a) A method of screening a compound or element or a salt thereof that changes the binding property or signal transduction of a metal element to GPR39, which comprises measuring the binding amount of a radioisotope of the metal  
35       element to GPR39 in the case wherein the radioisotope of the metal element is

brought in contact with GPR39 and in the case wherein the radioisotope of the metal element and a test compound or element or a salt thereof are brought in contact with GPR39, and comparing the cases.

5       b) A method of screening a compound or element or a salt thereof that changes the binding property or signal transduction of a metal element to GPR39, which comprises measuring the binding amount of a radioisotope of the metal element to a cell containing GPR39 or a membrane fraction of said cell, in the case wherein the radioisotope of the metal element is brought in contact with the cell containing GPR39 or a membrane fraction of said cell and in the case wherein the  
10       radioisotope of the metal element and a test compound or element or a salt thereof are brought in contact with the cell containing GPR39 or said membrane fraction, and comparing the cases.

      c) A method of screening a compound or element or a salt thereof that changes the binding property or signal transduction of a metal element to GPR39,  
15       which comprises measuring the amount of a radioisotope of the metal element bound to GPR39, in the case wherein the radioisotope of the metal element is brought in contact with GPR39 expressed on a cell membrane by culturing a transformant containing the DNA of the present invention and in the case wherein the radioisotope of the metal element and a test compound or element or a salt thereof are brought in  
20       contact with GPR39 expressed on the cell membrane by culturing a transformant containing the DNA of the present invention, and comparing the cases.

      d) A method of screening a compound or element or a salt thereof that changes the binding property or signal transduction of a metal element to GPR39, which comprises assaying GPR39-mediated cell stimulating activities in the case  
25       wherein a compound (e.g., a metal element or its radioisotope, etc.) that activates GPR39 is brought in contact with a cell containing GPR39 and in the case wherein a compound that activates GPR39 and a test compound or element or a salt thereof are brought in contact with the cell containing GPR39, and comparing the cell stimulating activities between the two cases.

30       e) A method of screening a compound or element or a salt thereof that changes the binding property or signal transduction of a metal element to GPR39, which comprises assaying the receptor-mediated cell stimulating activities in the case wherein a compound (e.g., a metal element or its radioisotope, etc.) that activates GPR39 is brought in contact with GPR39 expressed on a cell membrane by culturing  
35       a transformant containing the DNA of the present invention and in the case wherein a

compound that activates GPR39 and a test compound or element or a salt thereof are brought in contact with GPR39 expressed on a cell membrane by culturing a transformant containing the DNA of the present invention, and comparing the cell stimulating activities between the two cases.

5           In addition, a compound or element or a salt thereof (a synthetic low molecular compound, especially a synthetic low molecular agonist) that changes the binding property of the metal element to GPR39 can be used as the ligand for GPR39 in place of the metal element described above. The compound or element or a salt thereof that changes the binding property of the metal element to GPR39 can be  
10       obtained by performing the screening methods later described using, e.g., the metal element as a ligand. In the following screening method, the compound or element or a salt thereof that changes the binding property of the metal element to GPR39 is all merely referred to as the ligand.

          Hereinafter the screening method of the present invention will be described  
15       more specifically.

          First, GPR39 used for the screening method of the present invention may be any one, so long as it contains GPR39 described above, though GPR39-containing membrane fractions from mammalian organs are preferably employed. Since it is very difficult to obtain human-derived organs especially, human-derived GPR39, etc.  
20       expressed abundantly by use of recombinants are suitable for use in the screening.

          In producing GPR39, the methods described above can be used and preferably, it is produced by expressing the DNA of the present invention expressed on mammalian cells or insect cells. As the DNA fragment encoding the target protein region, a complementary DNA may be used but is not limited thereto. For example,  
25       gene fragments or a synthetic DNA may also be used as the DNA fragment. In order to introduce the DNA fragment encoding GPR39 into host animal cells and express the same efficiently, the DNA fragment is preferably incorporated into a polyhedron promoter of nuclear polyhedrosis virus (NPV) belonging to the Baculovirus, an SV40-derived promoter, a promoter of retrovirus, a metallothionein promoter, a  
30       human heat shock promoter, a cytomegalovirus promoter, SR $\alpha$  promoter, etc. at the downstream thereof. The quantity and quality of the thus expressed receptors can be examined by a publicly known method, for example, by the method described in the literature [Nambi, P. et al., J. Biol. Chem., 267, 19555-19559, 1992].

          Accordingly, in the screening method of the present invention, the substance  
35       containing GPR39 may be GPR39 purified by publicly known methods, or a cell

containing said GPR39 or a membrane fraction of the cell containing said GPR39 may be used as well.

Where the GPR39-containing cell is used in the screening method of the present invention, the cell may be fixed with glutaraldehyde, formalin, etc. The  
5 fixation may be carried out by a publicly known method.

The cell containing GPR39 refers to a host cell expressing the GPR39. Examples of such a host cell include *Escherichia coli*, *Bacillus subtilis*, yeast, insect cells, animal cells, etc.

The cell membrane fraction refers to a fraction abundant in cell membrane  
10 obtained by cell disruption and subsequent fractionation by publicly known methods. Cell disruption methods include cell squashing using a Potter-Elvehjem homogenizer, disruption using a Waring blender or Polytron (manufactured by Kinematica Inc.), disruption by ultrasonication, disruption by cell spraying through thin nozzles under an increased pressure using a French press, or the like. Cell membrane fractionation  
15 is effected mainly by fractionation using a centrifugal force, such as centrifugation for fractionation and density gradient centrifugation. For example, cell disruption fluid is centrifuged at a low speed (500 rpm to 3,000 rpm) for a short period of time (normally about 1 to about 10 minutes), the resulting supernatant is then centrifuged at a higher speed (15,000 rpm to 30,000 rpm) normally for 30 minutes to 2 hours.  
20 The precipitate thus obtained is used as the membrane fraction. The membrane fraction is abundant in GPR39 expressed and membrane components such as cell-derived phospholipids, membrane proteins, etc.

The amount of GPR39 in the GPR39-containing cell or membrane fraction is preferably  $10^3$  to  $10^8$  molecules per cell, more preferably  $10^5$  to  $10^7$  molecules per  
25 cell. As the level of expression increases, the ligand binding activity per unit of membrane fraction (specific activity) increases so that not only the highly sensitive screening system can be constructed but also large quantities of samples can be assayed with the same lot.

To perform a) through c) described above for screening the compound or its  
30 salt that changes the binding property or signal transduction of the ligand to GPR39, an appropriate GPR39 fraction and a labeled ligand are required.

The GPR39 fraction is preferably a fraction of naturally occurring type GPR39 or a fraction of recombinant GPR39 having an activity equivalent thereto. Herein, the equivalent activity is intended to mean the ligand binding activity or the  
35 signal transduction activity, which is equivalent to the activity possessed by naturally

occurring type GPR39.

As the labeled ligand, radioisotopes of the ionizable metal element such as cadmium, zinc, copper, nickel, etc. are employed. For example, zinc 65 ( $^{65}\text{Zn}$ ), nickel 63 ( $^{63}\text{Ni}$ ), etc. are used. Among them, nickel 63 ( $^{63}\text{Ni}$ ) is preferred.

5           Specifically, the compound or element or a salt thereof that changes the binding property or signal transduction of the ligand to GPR39 is screened by the following procedures. First, a GPR39 preparation is prepared by suspending a cell containing GPR39 or a membrane fraction of the cell in a buffer appropriate for use in the screening method. Any buffer can be used so long as it does not interfere the  
10   ligand-GPR39 binding, including a phosphate buffer or a Tris-HCl buffer, having pH of 4 to 10 (preferably pH of 6 to 8), etc. For the purpose of minimizing non-specific binding, a surfactant such as CHAPS, Tween-80<sup>TM</sup> (Kao-Atlas Inc.), digitonin, deoxycholate, etc., may optionally be added to the buffer. Further for the purpose of suppressing the degradation of the receptor or ligand by a protease, a protease  
15   inhibitor such as PMSF, leupeptin, E-64 (manufactured by Peptide Institute, Inc.), pepstatin, etc. may also be added. A given amount (5,000 cpm to 500,000 cpm) of the labeled ligand is added to 0.01 ml to 10 ml of the receptor solution, in which  $10^{-4}$  M to  $10^{-10}$  M of a test compound is co-present. To determine the amount of non-specific binding (NSB), a reaction tube containing an unlabeled ligand in a large excess is  
20   also provided. The reaction is carried out at approximately 0°C to 50°C, preferably approximately 4°C to 37°C for about 20 minutes to about 24 hours, preferably about 30 minutes to 3 hours. After completion of the reaction, the reaction mixture is filtrated through glass fiber filter paper, etc. and washed with an appropriate volume of the same buffer. The residual radioactivity on the glass fiber filter paper is then  
25   measured by means of a liquid scintillation counter or  $\gamma$ -counter. When nonspecific binding (NSB) is subtracted from the count ( $B_0$ ) where any antagonizing substance is absent and the resulting count ( $B_0$  minus NSB) is made 100%, the test compound showing the specific binding amount ( $B$  minus NSB) of, e.g., 50% or less may be selected as a candidate compound.

30           The method d) or e) described above for screening the compound or element or a salt thereof that changes the binding property or signal transduction of the ligand to GPR39 or signal transduction can be performed as follows. For example, GPR39-mediated cell stimulating activities can be determined by a publicly known method, or using an assay kit commercially available.

35           Specifically, the cells containing GPR39 are first cultured in a multiwell

plate, etc. Prior to screening, the medium is replaced with fresh medium or with an appropriate non-cytotoxic buffer, followed by incubation for a given period of time in the presence of a test compound, etc. Subsequently, the cells are extracted or the supernatant is recovered and the resulting product is quantified by appropriate procedures. Where it is difficult to detect the production of the cell-stimulating activity indicator (e.g., cAMP, arachidonic acid, etc.) due to a degrading enzyme contained in the cells, an inhibitor against such as a degrading enzyme may be added prior to the assay. For detecting the activities such as the cAMP production suppression activity, the baseline production in the cells is increased by forskolin or the like and the suppressing effect on the increased baseline production can be detected.

For screening through the assay for the cell stimulating activities, cells, in which an appropriate GPR39 has been expressed, are necessary. Preferred cells, in which GPR39 has been expressed, are a naturally occurring type cell line containing GPR39 and the aforesaid cell line, in which recombinant type GPR39 has been expressed.

Examples of the test compounds include peptides, proteins, non-peptide compounds, synthetic compounds, fermentation products, cell extracts, plant extracts, animal tissue extracts, blood plasma, etc. These test compounds may be either novel or publicly known compounds.

As salts of the test compound, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

As the test elements, the elements described in, e.g., the Periodic Table, are used. Among them, metal elements are preferred.

Salts of the test elements include, for example, salts with acids such as hydrochloric acid, sulfuric acid, nitric acid, acetic acid, etc.

The test compound which is preferably used is a compound designed to bind to the ligand-binding pocket, based on the atomic coordinate and the position of the ligand-binding pocket in the active site of GPR39. The atomic coordinate and the

position of the ligand-binding pocket in the active site of GPR39 can be determined by publicly known methods or modifications thereof.

By using the method of screening the agonist for GPR39 described above, it can be confirmed whether the compound that changes the binding property of the ligand to GPR39 is either an agonist or an antagonist.

Specifically, the confirmation can be made by (i) or (ii) below.

(i) By binding assay as shown by the screening methods a) to c) described above, the compound that changes the binding property of the metal element to GPR39 (especially inhibits the binding) is obtained. It is then determined whether or not the compound possesses the cell stimulating activity described above. When the compound or its salt has the cell stimulating activity, it is an agonist for GPR39, whereas the compound or its salt having no cell stimulating activity is an antagonist to GPR39.

(ii) (a) A test compound is brought in contact with a cell containing GPR39 to assay the cell stimulating activity described above. The test compound or its salt having the cell stimulating activity is an agonist for GPR39.

(b) The cell stimulating activity is assayed in the case wherein a compound that activates GPR39 (e.g., a metal element) is brought in contact with a cell containing GPR39 and in the case wherein a compound that activates GPR39 and a test compound are brought in contact with a cell containing GPR39, and comparison is made therebetween. The test compound, which can decrease the cell stimulating activity mediated by the compound or its salt that activates GPR39, is an antagonist to GPR39.

The kit for screening the compound or its salt that changes the binding property or signal transduction of the ligand to GPR39 is a kit comprising GPR39, a cell containing GPR39, or a membrane fraction of the cell containing GPR39, and the like.

Examples of the screening kit of the present invention include the following.

1. Reagent for screening

a) Assay buffer and wash buffer

Hanks' balanced salt solution (manufactured by Gibco, Inc.) supplemented with 0.05% bovine serum albumin (manufactured by Sigma, Inc.)

The solution is sterilized by filtration through a 0.45  $\mu\text{m}$  filter, and stored at 4°C or may be prepared at use.

b) GPR39 Preparation

CHO cells wherein GPR39 has been expressed are passaged in a 12-well plate at a density of  $5 \times 10^5$  cells/well followed by culturing at 37°C under 5% CO<sub>2</sub> and 95% air for 2 days.

c) Labeled ligand

5 A radioisotope such as zinc 65 (<sup>65</sup>Zn), nickel 63 (<sup>63</sup>Ni), etc.

An aqueous solution is stored at 4°C or -20°C and diluted to 1 μM with the assay buffer upon use.

d) Standard ligand solution

10 The ligand is dissolved in and adjusted to 1 mM with PBS containing 0.1% bovine serum albumin (manufactured by Sigma, Inc.) and stored at -20°C.

2. Assay method

a) CHO cells wherein GPR39 has been expressed are cultured in a 12-well culture plate and washed twice with 1 ml of the assay buffer, and 490 μl of the assay buffer is added to each well.

15 b) After adding 5 μl of  $10^{-3}$  -  $10^{-10}$  M test compound solution, 5 μl of a labeled ligand is added to the mixture, and the cells are incubated at room temperature for an hour. To determine the amount of the non-specific binding, 5 μl of the non-labeled ligand is added in place of the test compound.

20 c) The reaction solution is removed, and the wells are washed 3 times with the washing buffer. The labeled ligand bound to the cells is dissolved in 0.2N NaOH-1% SDS, and mixed with 4 ml of liquid scintillator A (manufactured by Wako Pure Chemical Industries, Ltd.)

d) The radioactivity is measured using a liquid scintillation counter (manufactured by Beckman Co.), and the percent maximum binding (PMB) is  
25 calculated by the equation below.

$$\text{PMB} = [(B - \text{NSB}) / (B_0 - \text{NSB})] \times 100$$

PMB : Percent maximum binding

B : Value obtained in the presence of a test compound

30 NSB : Non-specific binding

B<sub>0</sub> : Maximum binding

The compound or element or a salt thereof, which is obtained by using the screening method or the screening kit of the present invention, is the compound or  
35 element or a salt thereof, which has the action of changing the binding property or

signal transduction of the metal element to GPR39 or signal transduction.

Specifically, the compound is: (a) a compound or element or a salt thereof having the cell-stimulating activity mediated by GPR39 (a so-called agonist for GPR39); (b) a compound or element or a salt thereof having no cell stimulating activity (a so-called antagonist to GPR39); (c) a compound or element or a salt thereof that potentiates the binding affinity of the metal element to GPR39; or (d) a compound or element or a salt thereof that reduces the binding affinity of the metal element to GPR39.

The compounds obtained by using screening method of the present invention include peptides, proteins, non-peptide compounds, synthetic compounds, fermentation products, etc. These compounds may be novel or known compounds.

As salts of the compound, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

As the elements obtained by the screening method or screening kit of the present invention, for example, the elements described in, e.g., the Periodic Table, are used. Among them, metal elements are preferred.

The salts of the elements include, for example, salts with acid such as hydrochloric acid, sulfuric acid, nitric acid, acetic acid, etc.

Since the agonists for GPR39 have the same physiological activities as those of the metal element, which is a ligand for GPR39, the agonists are useful as safe and low toxic pharmaceuticals, correspondingly to the physiological activity possessed by the metal element.

Since the antagonists to GPR39 can suppress the physiological activities possessed by the metal element, which is a ligand for GPR39, the antagonists are useful as safe and low toxic pharmaceuticals to suppress the physiological activities of the metal element.

The compound or element or a salt thereof that potentiates the binding affinity of the metal element to GPR39 can potentiate the physiological activity the metal element has, and is thus useful as a safe and low toxic pharmaceutical correspondingly to the physiological activity possessed by the metal element.

The compound or element or a salt thereof that reduces the binding affinity of the metal element to GPR39, element or its salt can reduce the physiological activities the metal element has, and is useful as a safe and low toxic pharmaceutical to suppress the physiological activity possessed by the metal element.

5 Specifically, the agonist for GPR39 or the compound or element or a salt thereof that potentiates the binding affinity of the metal element to GPR39 is useful as a prophylactic/therapeutic agent for diseases, for example, metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, 10 arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, 15 etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc., or as an agent for promoting the secretion of cytokines (e.g., IL-8).

On the other hand, the antagonist to GPR39 or the compound or element or a salt thereof that reduces the binding affinity of the metal element to GPR39 is useful as a prophylactic/therapeutic agent for diseases, for example, excess 20 metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders 25 caused by urinary calculus, etc., an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic 30 obstructive pulmonary disease (COPD)), etc.

Where the compound or element or a salt thereof, which is obtained by the screening method of the present invention, is used as a pharmaceutical composition above, the compound or element or a salt thereof can be prepared into a pharmaceutical preparation in a conventional manner.

35 For example, the compound or its salt can be used orally in the form of

tablets which may be tablets, if necessary, coated with sugar, capsules, elixirs, microcapsules, etc., or parenterally in the form of injectable preparations such as a sterile solution or a suspension in water or with other pharmaceutically acceptable liquid. These preparations can be manufactured, e.g., by mixing the compound, with  
 5 a physiologically acceptable known carrier, flavoring agent, excipient, vehicle, antiseptic, stabilizer, binder, etc., in a unit dosage form required in a generally accepted manner applied to making pharmaceutical preparations. The active ingredient in the preparation is controlled in such an amount that an appropriate dose is obtained within the specified range given.

10 Additives miscible with tablets, capsules, etc. include a binder such as gelatin, corn starch, tragacanth or gum arabic, an excipient such as crystalline cellulose, a puffiness agent such as corn starch, gelatin, alginic acid, etc., a lubricant such as magnesium stearate, a sweetening agent such as sucrose, lactose or saccharin, a flavoring agent such as peppermint, akamono oil or cherry, and the like. When the  
 15 unit dosage is in the form of capsules, liquid carriers such as oils and fats may further be used together with the additives described above. A sterile composition for injection may be formulated following a conventional manner used to make pharmaceutical compositions, e.g., by dissolving or suspending the active ingredients in a vehicle such as water for injection with a naturally occurring vegetable oil such  
 20 as sesame oil, coconut oil, etc. to prepare the pharmaceutical composition. Examples of an aqueous medium for injection include physiological saline, an isotonic solution containing glucose and other auxiliary agents (e.g., D-sorbitol, D-mannitol, sodium chloride, etc.) or the like, which may be used in combination with an appropriate dissolution aid such as an alcohol (e.g., ethanol), a polyalcohol (e.g., propylene  
 25 glycol, polyethylene glycol), a nonionic surfactant (e.g., polysorbate 80<sup>TM</sup> and HCO-50), etc. As an oily medium, for example, sesame oil, soybean oil or the like may be used, and may be used in combination with a dissolution aid such as benzyl benzoate, benzyl alcohol, etc.

Furthermore, the preventive/therapeutic agent described above may also be  
 30 formulated with a buffer (e.g., phosphate buffer, sodium acetate buffer), a soothing agent (e.g., benzalkonium chloride, procaine hydrochloride, etc.), a stabilizer (e.g., human serum albumin, polyethylene glycol, etc.), a preservative (e.g., benzyl alcohol, phenol, etc.), an antioxidant, etc. The thus prepared liquid for injection is normally filled in an appropriate ampoule.

35 Since the thus obtained pharmaceutical preparation is safe and low toxic, the

preparation can be administered to human or mammal (e.g., rats, mice, rabbits, sheep, swine, bovine, cats, dogs, monkeys, etc.).

The dose of the compound or element or a salt thereof varies depending on subject to be administered, target organ, conditions, method for administration, etc.;  
 5 in oral administration, the agonist for GPR39 is administered to the patient (as 60 kg body weight) with, e.g., cancer normally in a dose of about 0.1 mg to about 100 mg, preferably about 1.0 to about 50 mg, and more preferably about 1.0 to about 20 mg per day. In parenteral administration, the single dose may vary depending on subject to be administered, target organ, conditions, method for administration, etc. but in the  
 10 form of injectable preparation, the agonist for GPR39 is advantageously administered intravenously to the patient (as 60 kg body weight) with, e.g., cancer in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg. For other animal species, the corresponding dose as converted per 60 kg can be administered.

15

#### (7) Methods for elucidation of the action mechanism of various drugs

By using GPR39, it can be confirmed whether or not various drugs exhibit GPR39-mediated pharmacological effects.

That is, the present invention provides the following methods.

20 (1) A method for confirming that a preventive/therapeutic drug for metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes  
 25 mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc.; excess metal-induced symptoms such as renal dysfunction,  
 30 pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., an agent for regulating  
 35 the secretion of cytokines (e.g., IL-8), a drug for regulating the secretion of cytokines

(e.g., IL-8), or a preventive/therapeutic drug for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)) binds to GPR39, which comprises using GPR39.

(2) A method for confirming that a preventive/therapeutic drug for metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc., or a drug for promoting the secretion of cytokines (e.g., IL-8) is an agonist for GPR39, which comprises using GPR39.

(3) A method for confirming that a preventive/therapeutic drug for excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., a drug for suppressing the secretion of cytokines (e.g., IL-8), or a preventive/therapeutic drug for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), etc. is an antagonist to GPR39, which comprises using GPR39.

(4) The screening method according to (1) to (3), wherein the binding amount of each drug to GPR39 is measured when the drug is brought in contact with GPR39.

This confirmation method can be performed by using the drug described above in place of the test compound in the above methods of screening the compound that changes the binding property of the metal element to GPR39.

The kit used for the confirmation method of the present invention comprises

the drug described above in place of the test compound, in the above kits for screening the compound that changes the binding property of the metal element to GPR39.

5 By using the confirmation method of the present invention as described above, it can be confirmed that various drugs commercially available or under development exhibit the GPR39-mediated pharmacological effects.

(8) Pharmaceutical comprising the compound or its salt that changes the amount of GPR39 or its partial peptide in cell membrane

10 The antibody of the present invention is capable of specifically recognizing GPR39 and can be used for screening the compound or its salt that changes the amount of GPR39 in the cell membrane.

That is, the present invention provides, for example, the following methods:

15 (i) a method of screening the compound or its salt that changes the amount of GPR39 in the cell membrane, which comprises measuring the amount of GPR39 contained in a) blood, b) particular organs or c) a cell membrane fraction isolated after disrupting tissues or cells isolated from the organs of non-human mammals;

(ii) a method of screening the compound or its salt that changes the amount of GPR39 in the cell membrane, which comprises disrupting transformants, etc. expressing GPR39, isolating the cell membrane fraction and quantifying GPR39 contained in the cell membrane fraction; and,

20 (iii) a method of screening the compound or its salt that changes the amount of GPR39 in the cell membrane, which comprises preparing a slice of a) blood, b) particular organs or c) tissues, cells, etc. isolated from organs of non-human mammals and quantifying the stained receptor protein on the cell surface using immunostaining assay thereby to confirm the protein on the cell membrane.

The present invention provides:

30 (iv) a method of screening the compound or its salt that changes the amount of GPR39 in the cell membrane, which comprises preparing a slice of a transformant expressing GPR39 and quantifying the stained receptor protein on the cell surface using immunostaining assay thereby to confirm the protein on the cell membrane.

Specifically, the GPR39 contained in the cell membrane fraction can be measured as follows.

35 (i) Normal or disease models of non-human mammals (e.g., mice, rats, rabbits, sheep, swine, bovine, cats, dogs, monkeys, more specifically, rats, mice or

rabbits with immunodeficiency, etc.) receive a drug (e.g., an immunomodulator, etc.) or physical stress (e.g., soaking stress, electric shock, light and darkness, low temperature, etc.), and the blood, particular organs (e.g., brain, liver, kidney, etc.), or tissues or cells isolated from the organs are obtained after a specified period of time.

5 The obtained organs, tissues, cells or the like are suspended in, for example, an appropriate buffer (e.g., Tris hydrochloride buffer, phosphate buffer, HEPES buffer, etc.), and the organs, tissues or cells are disrupted, and the cell membrane fraction is obtained using surfactants (e.g., Triton-X 100<sup>TM</sup>, Tween 20<sup>TM</sup>) and further using techniques such as centrifugal separation, filtration, column fractionation, etc.

10 The cell membrane fraction refers to a fraction abundant in cell membrane obtained by cell disruption and subsequent fractionation by publicly known methods. Cell disruption methods include cell squashing using a Potter-Elvehjem homogenizer, disruption using a Waring blender or Polytron (manufactured by Kinematica Inc.), disruption by ultrasonication, disruption by cell spraying through thin nozzles under  
15 an increased pressure using a French press, or the like. Cell membrane fractionation is effected mainly by fractionation using a centrifugal force, such as centrifugation for fractionation and density gradient centrifugation. For example, cell disruption fluid is centrifuged at a low speed (500 rpm to 3,000 rpm) for a short period of time (normally about 1 to about 10 minutes), the resulting supernatant is then centrifuged  
20 at a higher speed (15,000 rpm to 30,000 rpm) normally for 30 minutes to 2 hours. The precipitate thus obtained is used as the membrane fraction. The membrane fraction is abundant in GPR39 expressed and membrane components such as cell-derived phospholipids, membrane proteins, etc.

The GPR39 contained in the cell membrane fraction can be quantified by,  
25 for example, the sandwich immunoassay, western blot analysis, etc. using the antibody of the present invention.

The sandwich immunoassay can be performed as described above, and the western blotting can be performed by publicly known methods.

(ii) Transformants expressing GPR39 are prepared by the method described  
30 above, and the GPR39 contained in the cell membrane fraction can be quantified.

The compound or its salt that changes the amount of GPR39 in cell membranes can be screened as follows.

(i) Normal non-human mammal or disease model of non-human mammal is administered with a test compound at a specified period of time before (30 minutes  
35 to 24 hours before, preferably 30 minutes to 12 hours before, more preferably 1 hour

to 6 hours before), at a specified time after (30 minutes to 3 days after, preferably 1 hour to 2 days after, more preferably 1 hour to 24 hours after), or simultaneously with a drug or physical stress. At a specified time (30 minute to 3 days, preferably 1 hour to 2 days, more preferably 1 hour to 24 hours) after administration of the test compound, the amount of GPR39 in the cell membranes can be quantified.

(ii) Transformants are cultured in a conventional manner and a test compound is mixed in the culture medium. After a specified time (after 1 day to 7 days, preferably after 1 day to 3 days, more preferably after 2 to 3 days), the amount of GPR39 in the cell membranes can be quantified.

Specifically, the GPR39 contained in cell membrane fractions is confirmed as follows.

(iii) Normal non-human mammals or disease models of non-human mammals (e.g., mice, rats, rabbits, sheep, swine, bovine, cats, dogs, monkeys, etc., more specifically, immunodeficiency model rats, mice, rabbits, etc.) are administered with drugs (e.g., an immunomodulator, etc.) or physical stress (e.g., soaking stress, electric shock, light and darkness, low temperature, etc.) or the like, and blood or particular organ (e.g., brain, liver, kidney, etc.), or the tissues or cells isolated from the organ are obtained after a specified period of time. Tissue sections are prepared from the thus obtained organs, tissues, cells, etc. in a conventional manner followed by immunostaining with the antibody of the present invention. The staining intensity of the receptor protein on the cell surface is quantified to confirm the protein on the cell membrane, whereby the amount of GPR39 on the cell membrane can be confirmed quantitatively or qualitatively.

(iv) The confirmation can also be made by the similar method, using transformants expressing GPR39.

Examples of the test compounds include peptides, proteins, non-peptide compounds, synthetic compounds, fermentation products, cell extracts, plant extracts, animal tissue extracts, blood plasma, etc. These test compounds may be either novel or publicly known compounds.

As salts of the test compound, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid,

citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

The compound or its salts obtained by the screening method of the present invention are the compound or its salts that have the action of changing the amount of GPR39 in cell membranes. Specifically, these compounds are: (a) a compound or its salts that increase the amount of GPR39 in cell membranes thereby to potentiate the G protein-coupled receptor-mediated cell-stimulating activities; and (b) a compound or its salts that decrease the amount of GPR39 in cell membranes thereby to attenuate the cell stimulating-activity.

The compounds may be peptides, proteins, non-peptide compounds, synthetic compounds, fermentation products, and these compounds may be novel or publicly known compounds.

As salts of the compound, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

The compound or its salts that increase the amount of GPR39 in cell membranes thereby to potentiate the cell-stimulating activity are useful as safe and low toxic preventive/therapeutic agents for diseases associated with the dysfunction of GPR39.

The compound or its salt that decreases the expression level of GPR39 in cell membranes thereby to attenuate the cell stimulating activity is useful as a safe and low toxic agent for preventing/treating diseases caused by the overexpression of GPR39.

Specifically, the compound or its salt that increases the amount of GPR39 in cell membranes can be used as a prophylactic/therapeutic agent for diseases, e.g., metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances,

indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc., or an agent for promoting the secretion of cytokines (e.g., IL-8).

On the other hand, the compound or its salt that decreases the amount of GPR39 in cell membranes can be used as a prophylactic/therapeutic agent for diseases, e.g., excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), etc.

Where the compound or its salt, which is obtained by using the screening method of the present invention, is used as the pharmaceutical composition above, the compound or its salt can be prepared into a pharmaceutical preparation in a conventional manner.

For example, the compound can be used orally in the form of tablets which may be tablets, if necessary, coated with sugar, capsules, elixirs, microcapsules, etc., or parenterally in the form of injectable preparations such as a sterile solution or a suspension in water or with other pharmaceutically acceptable liquid. These preparations can be manufactured, e.g., by mixing the compound, with a physiologically acceptable known carrier, flavoring agent, excipient, vehicle, antiseptic, stabilizer, binder, etc., in a unit dosage form required in a generally accepted manner applied to making pharmaceutical preparations. The active ingredient in the preparation is controlled in such an amount that an appropriate dose is obtained within the specified range given.

Additives miscible with tablets, capsules, etc. include a binder such as gelatin, corn starch, tragacanth or gum arabic, an excipient such as crystalline cellulose, a puffiness agent such as corn starch, gelatin, alginic acid, etc., a lubricant

such as magnesium stearate, a sweetening agent such as sucrose, lactose or saccharin, a flavoring agent such as peppermint, akamono oil or cherry, and the like. When the unit dosage is in the form of capsules, liquid carriers such as oils and fats may further be used together with the additives described above. A sterile composition for injection may be formulated following a conventional manner used to make pharmaceutical compositions, e.g., by dissolving or suspending the active ingredients in a vehicle such as water for injection with a naturally occurring vegetable oil such as sesame oil, coconut oil, etc. to prepare the pharmaceutical composition. Examples of an aqueous medium for injection include physiological saline, an isotonic solution containing glucose and other auxiliary agents (e.g., D-sorbitol, D-mannitol, sodium chloride, etc.) or the like, which may be used in combination with an appropriate dissolution aid such as an alcohol (e.g., ethanol), a polyalcohol (e.g., propylene glycol, polyethylene glycol), a nonionic surfactant (e.g., polysorbate 80<sup>TM</sup> and HCO-50), etc. As an oily medium, for example, sesame oil, soybean oil or the like may be used, which can be used in combination with a dissolution aid such as benzyl benzoate, benzyl alcohol, etc.

Furthermore, the preventive/therapeutic agent described above may also be formulated with a buffer (e.g., phosphate buffer, sodium acetate buffer), a soothing agent (e.g., benzalkonium chloride, procaine hydrochloride, etc.), a stabilizer (e.g., human serum albumin, polyethylene glycol, etc.), a preservative (e.g., benzyl alcohol, phenol, etc.), an antioxidant, etc. The thus prepared liquid for injection is normally filled in an appropriate ampoule.

Since the thus obtained pharmaceutical preparation is safe and low toxic, the preparation can be administered to human or mammals (e.g., rats, mice, rabbits, sheep, swine, bovine, cats, dogs, monkeys, etc.).

The dose of the compound or its salts varies depending on subject to be administered, target organ, conditions, methods for administration, etc.; in oral administration, the compound or its salt that increases the amount of GPR39 in cell membranes is administered to the patient (as 60 kg body weight) with, e.g., cancer normally in a dose of about 0.1 mg to about 100 mg, preferably about 1.0 to about 50 mg, and more preferably about 1.0 to about 20 mg per day. In parenteral administration, the single dose may vary depending on subject to be administered, target organ, conditions, methods for administration, etc. but in the form of, e.g., injectable preparation, the compound or its salt that increases the amount of GPR39 in cell membranes is advantageously administered intravenously to the patient (as 60

kg body weight) with, e.g., cancer in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg. For other animal species, the corresponding dose as converted per 60 kg can be administered.

5

#### (9) Pharmaceutical comprising the antibody to GPR39

The neutralizing activity of the antibody to GPR39 means the activity of inactivating the signal transduction function in which GPR39 takes part. Thus, when the antibody has the neutralizing activity, the antibody can inactivate signal  
10 transduction in which GPR39 takes part, for example, the GPR39-mediated cell stimulating activities (e.g., the activities that promote or inhibit arachidonic acid release, acetylcholine release, intracellular  $\text{Ca}^{2+}$  release, intracellular cAMP production, intracellular cGMP production, inositol phosphate production, changes in cell membrane potential, phosphorylation of intracellular proteins, activation of c-fos,  
15 pH reduction, etc.; an action of promoting the secretion of cytokines (e.g., IL-8) etc., in particular, intracellular  $\text{Ca}^{2+}$  level increasing activity (intracellular  $\text{Ca}^{2+}$  release activity), an action of promoting the secretion of cytokines (e.g., IL-8)).

Therefore, the antibody to GPR39 (e.g., a neutralizing antibody) can be used as a prophylactic/therapeutic agent for diseases caused by the excessive action of  
20 GPR39 or abundance of the metal element, for example, excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic  
25 visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia),  
30 allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), etc.

The preventive/therapeutic agent described above can be prepared in the same manner as in the aforesaid pharmaceutical composition comprising the GPR39 or the antagonist to the GPR39 and provided for use.

35

## (10) Pharmaceutical comprising the antisense DNA of the present invention

The antisense DNA of the present invention can be used as a prophylactic/therapeutic agent for diseases caused by the excessive action of GPR39, abundance of the metal element or the like, for example, excess metal-induced  
 5 symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by  
 10 urinary calculus, etc., an agent for suppressing the secretion of cytokines (e.g., IL-8), or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary  
 15 disease (COPD)), etc.

For example, where the antisense DNA is used, the antisense DNA itself is administered; alternatively, the antisense DNA is inserted into an appropriate vector such as retrovirus vector, adenovirus vector, adenovirus-associated virus vector, etc. and then administered in a conventional manner. The antisense DNA may also be  
 20 administered as naked, or with adjuvants to assist its uptake by gene gun or through a catheter such as a catheter with a hydrogel.

In addition, the antisense DNA may also be used as an oligonucleotide probe for diagnosis to investigate the presence of the DNA of the present invention or the state of its expression in tissues or cells.

25

## (11) Preparation of animal bearing the DNA of the present invention

The present invention provides a non-human mammal bearing DNA which is exogenous (hereinafter briefly referred to as the exogenous DNA of the present invention) or its variant DNA (sometimes briefly referred to as the exogenous variant  
 30 DNA of the present invention).

That is, the present invention provides:

- [1] A non-human mammal bearing the exogenous DNA of the present invention or its variant DNA;
- [2] The mammal according to [1], wherein the non-human mammal is a rodent;
- 35 [3] The mammal according to [2], wherein the rodent is mouse or rat; and,

[4] A recombinant vector containing the exogenous DNA of the present invention or its variant DNA and capable of expressing in a mammal; etc.

The non-human mammal bearing the exogenous DNA of the present invention or its variant DNA (hereinafter simply referred to as the DNA transgenic animal of the present invention) can be produced by transferring a desired DNA into an unfertilized egg, a fertilized egg, a spermatozoon, a germinal cell containing a primordial germinal cell thereof, or the like, preferably in the embryogenic stage in the development of a non-human mammal (more preferably in the single cell or fertilized cell stage and generally before the 8-cell phase), by standard means, such as the calcium phosphate method, the electric pulse method, the lipofection method, the agglutination method, the microinjection method, the particle gun method, the DEAE-dextran method, etc. Also, it is possible to transfer the exogenous DNA of the present invention into a somatic cell, a living organ, a tissue cell, or the like by the DNA transfer, and utilize the transformant for cell culture, tissue culture, etc. In addition, these cells may be fused with the above-described germinal cell by a publicly known cell fusion method to prepare the DNA transgenic animal of the present invention.

Examples of the non-human mammal that can be used include bovine, swine, sheep, goat, rabbits, dogs, cats, guinea pigs, hamsters, mice, rats, etc. Above all, preferred are rodents, especially mice (e.g., C57Bl/6 strain, DBA2 strain, etc. for a pure line and for a cross line, B6C3F<sub>1</sub> strain, BDF<sub>1</sub> strain B6D2F<sub>1</sub> strain, BALB/c strain, ICR strain, etc.), rats (Wistar, SD, etc.) or the like, since they are relatively short in ontogeny and life cycle from a standpoint of producing model animals for human disease.

"Mammal" in a recombinant vector that can be expressed in the mammals includes the aforesaid non-human mammal and human.

The exogenous DNA of the present invention refers to the DNA of the present invention that is once isolated and extracted from mammal, not the DNA of the present invention inherently possessed by the non-human mammal.

The mutant DNA of the present invention includes mutants resulting from variation (e.g., mutation, etc.) in the base sequence of the original DNA of the present invention, specifically DNAs resulting from base addition, deletion, substitution with other bases, etc. and further including abnormal DNA.

The abnormal DNA is intended to mean DNA that expresses the abnormal GPR39 and exemplified by the DNA that expresses GPR39 for suppressing the

function of normal GPR39.

The exogenous DNA of the present invention may be any one of those derived from a mammal of the same species as, or a different species from, the mammal as the target animal. In transferring the DNA of the present invention, it is generally advantageous to use the DNA as a DNA construct in which the DNA is ligated downstream a promoter capable of expressing the DNA in the target animal. For example, in the case of transferring the human DNA of the present invention, a DNA transgenic mammal that expresses the DNA of the present invention to a high level, can be prepared by microinjecting a DNA construct (e.g., vector, etc.) ligated with the human DNA of the present invention into a fertilized egg of the target non-human mammal downstream various promoters which are capable of expressing the DNA derived from various mammals (e.g., rabbits, dogs, cats, guinea pigs, hamsters, rats, mice, etc.) bearing the DNA of the present invention highly homologous to the human DNA.

As expression vectors for GPR39, there are *Escherichia coli*-derived plasmids, *Bacillus subtilis*-derived plasmids, yeast-derived plasmids, bacteriophages such as  $\lambda$  phage, retroviruses such as Moloney leukemia virus, etc., and animal viruses such as vaccinia virus, baculovirus, etc. Of these vectors, *Escherichia coli*-derived plasmids, *Bacillus subtilis*-derived plasmids, or yeast-derived plasmids, etc. are preferably used.

Examples of these promoters for regulating the DNA expression include (i) promoters for DNA derived from viruses (e.g., simian virus, cytomegalovirus, Moloney leukemia virus, JC virus, breast cancer virus, poliovirus, etc.) and (ii) promoters derived from various mammals (human, rabbits, dogs, cats, guinea pigs, hamsters, rats, mice, etc.), for example, promoters of albumin, insulin II, uroplakin II, elastase, erythropoietin, endothelin, muscular creatine kinase, glial fibrillary acidic protein, glutathione S-transferase, platelet-derived growth factor  $\beta$ , keratins K1, K10 and K14, collagen types I and II, cyclic AMP-dependent protein kinase  $\beta$ I subunit, dystrophin, tartarate-resistant alkaline phosphatase, atrial natriuretic factor, endothelial receptor tyrosine kinase (generally abbreviated as Tie2), sodium-potassium adenosine triphosphorylase (Na,K-ATPase), neurofilament light chain, metallothioneins I and IIA, metalloproteinase I tissue inhibitor, MHC class I antigen (H-2L), H-ras, renin, dopamine  $\beta$ -hydroxylase, thyroid peroxidase (TPO), protein chain elongation factor 1 $\alpha$  (EF-1 $\alpha$ ),  $\beta$  actin,  $\alpha$  and  $\beta$  myosin heavy chains, myosin light chains 1 and 2, myelin base protein, thyroglobulins, Thy-1,

immunoglobulins, H-chain variable region (VNP), serum amyloid component P, myoglobin, troponin C, smooth muscle  $\alpha$  actin, preproencephalin A, vasopressin, etc. Among them, cytomegalovirus promoters, human protein elongation factor 1 $\alpha$  (EF-1 $\alpha$ ) promoters, human and fowl  $\beta$  actin promoters, etc., which are capable of high expression in the whole body are preferred.

Preferably, the vectors described above have a sequence that terminates the transcription of the desired messenger RNA in the DNA transgenic animal (generally termed a terminator); for example, a sequence of each DNA derived from viruses and various mammals, and SV40 terminator of the simian virus and the like are preferably used.

In addition, for further enhancing the expression of a foreign DNA of interest, a splicing signal, an enhancer region, a portion of the intron of eukaryotic DNA, etc. for each DNA can be ligated at the 5' upstream of a promoter region, between the promoter region and a translation region, or at the 3' downstream of the translation region, depending upon the purpose.

The translational region for normal GPR39 can be obtained using as a starting material the entire genomic DNA or its portion of liver, kidney, thyroid cell or fibroblast origin from human or various mammals (e.g., rabbits, dogs, cats, guinea pigs, hamsters, rats, mice, etc.) or various commercially available genomic DNA libraries, or using cDNA prepared by a publicly known method from RNA of liver, kidney, thyroid cell or fibroblast origin as a starting material. Also, an exogenous abnormal DNA can produce the translational region through variation of the translational region of normal GPR39 obtained from the cells or tissues described above by point mutagenesis.

The translational region can be prepared by a conventional DNA engineering technique, in which the DNA is ligated downstream the aforesaid promoter and if desired, upstream the translation termination site, as a DNA construct capable of being expressed in the transgenic animal.

The exogenous DNA of the present invention is transferred at the fertilized egg cell stage in a manner such that the DNA is certainly present in all the germinal cells and somatic cells of the target mammal. The fact that the exogenous DNA of the present invention is present in the germinal cells of the animal prepared by DNA transfer means that all offspring of the prepared animal will maintain the exogenous DNA of the present invention in all of the germinal cells and somatic cells thereof.

The offspring of the animal that inherits the exogenous DNA of the present invention

also have the exogenous DNA of the present invention in all of the germinal cells and somatic cells thereof.

The non-human mammal in which the normal exogenous DNA of the present invention has been transferred can be passaged as the DNA-bearing animal under ordinary rearing environment, by confirming that the exogenous DNA is stably retained by crossing.

By transfer of the exogenous DNA of the present invention at the fertilized egg cell stage, the DNA is retained to be excess in all of the germinal and somatic cells. The fact that the exogenous DNA of the present invention is excessively present in the germinal cells of the prepared animal after transfer means that the DNA of the present invention is excessively present in all of the germinal cells and somatic cells thereof. The offspring of the animal that inherits the exogenous DNA of the present invention have excessively the DNA of the present invention in all of the germinal cells and somatic cells thereof.

It is possible to obtain homozygous animals having the transferred DNA in both homologous chromosomes and breed male and female of the animal so that all the progeny have this DNA in excess.

In a non-human mammal bearing the normal DNA of the present invention, the normal DNA of the present invention has expressed at a high level, and may eventually develop hyperfunction symptoms of GPR39 by accelerating the function of endogenous normal DNA. Therefore, the animal can be utilized as a pathologic model animal for such a disease. For example, using the normal DNA transgenic animal of the present invention, it is possible to elucidate the mechanism of hyperfunction symptoms of GPR39 and the pathological mechanism of the disease associated with GPR39 and to investigate how to treat these diseases.

Furthermore, since a mammal transferred with the exogenous normal DNA of the present invention exhibits symptoms of increasing GPR39, the animal is usable for screening of a drug for the treatment of diseases associated with GPR39.

On the other hand, a non-human mammal having the exogenous abnormal DNA of the present invention can be passaged under normal breeding conditions as the DNA-bearing animal by confirming stable retention of the exogenous DNA via crossing. Furthermore, the exogenous DNA of interest can be utilized as a starting material by inserting the DNA into the plasmid described above. The DNA construct with a promoter can be prepared by conventional DNA engineering techniques. The transfer of the abnormal DNA of the present invention at the fertilized egg cell stage

is preserved to be present in all of the germinal and somatic cells of the target mammal. The fact that the abnormal DNA of the present invention is present in the germinal cells of the animal after DNA transfer means that all of the offspring of the prepared animal have the abnormal DNA of the present invention in all of the germinal and somatic cells. Such an offspring that passaged the exogenous DNA of the present invention will have the abnormal DNA of the present invention in all of the germinal and somatic cells. A homozygous animal having the introduced DNA on both of homologous chromosomes can be acquired, and by crossing these male and female animals, all the offspring can be bred to retain the DNA.

In a non-human mammal bearing the abnormal DNA of the present invention, the abnormal DNA of the present invention has expressed to a high level, and may eventually develop the function inactive type inadaptability to GPR39 by inhibiting the functions of endogenous normal DNA. Therefore, the animal can be utilized as a pathologic model animal for such a disease. For example, using the abnormal DNA transgenic animal of the present invention, it is possible to elucidate the mechanism of the function inactive type inadaptability to GPR39 and the pathological mechanism of the disease and to investigate how to treat the disease.

More specifically, the transgenic animal of the present invention expressing the abnormal DNA of the present invention at a high level is expected to serve as an experimental model to elucidate the mechanism of the functional inhibition (dominant negative effect) of normal GPR39 by the abnormal GPR39 in the function inactive type inadaptability to GPR39.

A mammal bearing the abnormal exogenous DNA of the present invention is also expected to serve in a test for screening a drug for the treatment of the function inactive type inadaptability to GPR39, since the animal exerts symptoms of increasing GPR39.

Other potential applications of two kinds of the DNA transgenic animals of the present invention described above further include, for example:

- (i) Use as a cell source for tissue culture;
- (ii) Analysis of the relation to GPR39 that is specifically expressed or activated by GPR39, by direct analysis of DNA or RNA in tissues of the DNA transgenic animal of the present invention or by analysis of GPR39 tissues expressed by the DNA;
- (iii) Research on the function of cells derived from tissues that are usually cultured only with difficulty, using cells in tissues bearing the DNA cultured by a standard tissue culture technique;

(iv) Screening a drug that enhances the functions of cells using the cells described in (iii) above;

(v) Isolation and purification of the variant GPR39 of the present invention and preparation of an antibody thereto;

5 and so on.

Furthermore, clinical conditions of a disease associated with GPR39 including the function inactive type inadaptability to GPR39 can be determined by using the DNA transgenic animal of the present invention. Also, pathological findings on each organ in a disease model associated with GPR39 can be obtained in  
10 more detail, leading to the development of a new method for treatment as well as the research and therapy of any secondary diseases associated with the disease.

It is also possible to obtain a free DNA-transferred cell by withdrawing each organ from the DNA transgenic animal of the present invention, mincing the organ and degrading with a proteinase such as trypsin, etc., followed by establishing the  
15 line of culturing or cultured cells. Furthermore, the DNA transgenic animal of the present invention can serve to identify cells capable of producing GPR39, and to study in association with apoptosis, differentiation or propagation or on the mechanism of signal transduction in them to inspect any abnormality therein. Thus, the DNA transgenic animal can provide an effective research material for GPR39 and  
20 for investigation of its function and effect.

To develop a drug for the treatment of diseases associated with GPR39, including the function inactive type inadaptability to GPR39, using the DNA transgenic animal of the present invention, an effective and rapid method for screening can be provided by using the method for inspection and the method for  
25 quantification, etc. described above. It is also possible to investigate and develop a method for DNA therapy for the treatment of diseases associated with GPR39, using the DNA transgenic animal of the present invention or a vector capable of expressing the exogenous DNA of the present invention.

### 30 (12) Knockout animal

The present invention provides a non-human mammalian embryonic stem cell bearing the DNA of the present invention inactivated and a non-human mammal deficient in expressing the DNA of the present invention.

Thus, the present invention provides:

35 [1] A non-human mammalian embryonic stem cell in which the DNA of the present

invention is inactivated;

[2] The embryonic stem cell according to [1], wherein the DNA is inactivated by introducing a reporter gene (e.g.,  $\beta$ -galactosidase gene derived from *Escherichia coli*);

5 [3] The embryonic stem cell according to [1], which is resistant to neomycin;

[4] The embryonic stem cell according to [1], wherein the non-human mammal is a rodent;

[5] The embryonic stem cell according to [4], wherein the rodent is mouse;

10 [6] A non-human mammal deficient in expressing the DNA of the present invention, wherein the DNA is inactivated;

[7] The non-human mammal according to [6], wherein the DNA is inactivated by inserting a reporter gene (e.g.,  $\beta$ -galactosidase derived from *Escherichia coli*) therein and the reporter gene is capable of being expressed under control of a promoter for the DNA of the present invention;

15 [8] The non-human mammal according to [6], which is a rodent;

[9] The non-human mammal according to [8], wherein the rodent is mouse; and,

[10] A method of screening a compound that promotes or inhibits (preferably inhibits) the activity of a promoter for the DNA of the present invention, which comprises administering a test compound to the mammal of [7] and detecting  
20 expression of the reporter gene.

The non-human mammal embryonic stem cell in which the DNA of the present invention is inactivated refers to a non-human mammal embryonic stem cell that suppresses the ability of the non-human mammal to express the DNA by artificially mutating the DNA of the present invention, or the DNA has no substantial  
25 ability to express GPR39 (hereinafter sometimes referred to as the knockout DNA of the present invention) by substantially inactivating the activities of GPR39 encoded by the DNA (hereinafter merely referred to as ES cell).

As the non-human mammal, the same examples as described above apply.

Techniques for artificially mutating the DNA of the present invention  
30 include deletion of a part or all of the DNA sequence and insertion of or substitution with other DNA, by genetic engineering. By these variations, the knockout DNA of the present invention may be prepared, for example, by shifting the reading frame of a codon or by disrupting the function of a promoter or exon.

Specifically, the non-human mammal embryonic stem cell in which the  
35 DNA of the present invention is inactivated (hereinafter merely referred to as the ES

cell with the DNA of the present invention inactivated or the knockout ES cell of the present invention) can be obtained by, for example, isolating the DNA of the present invention that the desired non-human mammal possesses, inserting a DNA fragment having a DNA sequence constructed by inserting a drug resistant gene such as a  
5 neomycin resistant gene or a hygromycin resistant gene, or a reporter gene such as lacZ ( $\beta$ -galactosidase gene) or cat (chloramphenicol acetyltransferase gene), etc. into its exon site thereby to disable the functions of exon, or integrating to a chromosome of the target animal by, e.g., homologous recombination, a DNA sequence that terminates gene transcription (e.g., polyA additional signal, etc.) in the intron  
10 between exons, thus inhibiting the synthesis of complete messenger RNA and eventually destroying the gene (hereinafter simply referred to as a targeting vector). The thus-obtained ES cells to the southern hybridization analysis with a DNA sequence on or near the DNA of the present invention as a probe, or to PCR analysis with a DNA sequence on the targeting vector and another DNA sequence near the  
15 DNA of the present invention which is not included in the targeting vector as primers, to select the knockout ES cell of the present invention.

The parent ES cells to inactivate the DNA of the present invention by homologous recombination, etc. may be of a strain already established as described above, or may originally be established in accordance with a modification of the  
20 known method by Evans and Kaufman described above. For example, in the case of mouse ES cells, currently it is common practice to use ES cells of the 129 strain. However, since their immunological background is obscure, the C57BL/6 mouse or the BDF<sub>1</sub> mouse (F<sub>1</sub> hybrid between C57BL/6 and DBA/2), wherein the low ovum availability per C57BL/6 in the C57BL/6 mouse has been improved by crossing with  
25 DBA/2, may be preferably used, instead of obtaining a pure line of ES cells with the clear immunological genetic background and for other purposes. The BDF<sub>1</sub> mouse is advantageous in that, when a pathologic model mouse is generated using ES cells obtained therefrom, the genetic background can be changed to that of the C57BL/6 mouse by back-crossing with the C57BL/6 mouse, since its background is of the  
30 C57BL/6 mouse, as well as being advantageous in that ovum availability per animal is high and ova are robust.

In establishing ES cells, blastocytes at 3.5 days after fertilization are commonly used. In the present invention, embryos are preferably collected at the 8-cell stage, after culturing until the blastocyte stage, the embryos are used to  
35 efficiently obtain a large number of early stage embryos.

Although the ES cells used may be of either sex, male ES cells are generally more convenient for generation of a germ cell line chimera. It is also desirable that sexes are identified as soon as possible to save painstaking culture time.

Methods for sex identification of the ES cell include the method in which a gene in the sex-determining region on the Y-chromosome is amplified by the PCR process and detected. When this method is used, one colony of ES cells (about 50 cells) is sufficient for sex-determination analysis, though which convention karyotype analysis required about  $10^6$  cells; therefore, the first selection of ES cells at the early stage of culture can be based on sex identification, and male cells can be selected early, which saves a significant amount of time at the early stage of culture.

Also, second selection can be achieved by, for example, confirmation of the number of chromosomes by the G-banding method. It is usually desirable that the chromosome number of the obtained ES cells be 100% of the normal number. However, when it is difficult to obtain the cells having the normal number of chromosomes due to physical operations, etc. in the cell establishment, it is desirable that the ES cell is again cloned to a normal cell (e.g., in a mouse cell having the number of chromosomes being  $2n = 40$ ) after knockout of the gene of the ES cells.

Although the embryonic stem cell line thus obtained shows a very high growth potential, it must be subcultured with great care, since it tends to lose its ontogenic capability. For example, the embryonic stem cell line is cultured at about  $37^{\circ}\text{C}$  in a carbon dioxide incubator (preferably 5% carbon dioxide and 95% air, or 5% oxygen, 5% carbon dioxide and 90% air) in the presence of LIF (1 to 10000 U/ml) on appropriate feeder cells such as STO fibroblasts, treated with a trypsin/EDTA solution (normally 0.001 to 0.5% trypsin/0.1 to about 5 mM EDTA, preferably about 0.1% trypsin/1 mM EDTA) at the time of passage to obtain separate single cells, which are then plated on freshly prepared feeder cells. This passage is normally conducted every 1 to 3 days; it is desirable that cells be observed at the passage and cells found to be morphologically abnormal in culture, if any, be abandoned.

Where ES cells are allowed to reach a high density in mono-layers or to form cell aggregates in suspension under appropriate conditions, it is possible to differentiate the ES cells to various cell types, for example, pariental and visceral muscles, cardiac muscle or the like [M. J. Evans and M. H. Kaufman, *Nature*, 292, 154, 1981; G. R. Martin, *Proc. Natl. Acad. Sci. U.S.A.*, 78, 7634, 1981; T. C. Doetschman et al., *Journal of Embryology Experimental Morphology*, 87, 27, 1985].

The cells deficient in expression of the DNA of the present invention, which are obtained from the differentiated ES cells of the present invention, are useful for studying GPR39 in vitro or GPR39 cytologically.

5 The non-human mammal deficient in expressing the DNA of the present invention can be distinguished from normal animal by assaying the amount of mRNA in the animal according to a publicly known method and comparing the expression level indirectly.

As the non-human mammal, the same examples as described above apply.

10 With respect to the non-human mammal deficient in expression of the DNA of the present invention, the DNA of the present invention can be made knockout by transferring a targeting vector, prepared as described above, to mouse embryonic stem cells or mouse oocytes, and conducting homologous recombination in which a targeting vector DNA sequence, wherein the DNA of the present invention is inactivated by the transfer, is replaced with the DNA of the present invention on a  
15 chromosome of a mouse embryonic stem cell or mouse oocytes.

The knockout cells with the disrupted DNA of the present invention can be identified by the southern hybridization analysis using as a probe a DNA fragment on or near the DNA of the present invention, or by the PCR analysis using as primers a DNA sequence on the targeting vector and another DNA sequence at the proximal  
20 region of other than the DNA of the present invention derived from mouse used in the targeting vector. When non-human mammal stem cells are used, a cell line wherein the DNA of the present invention is inactivated by homologous recombination is cloned; the resulting clones are injected to, e.g., a non-human mammalian embryo or blastocyst, at an appropriate stage such as the 8-cell stage.  
25 The resulting chimeric embryos are transplanted to the uterus of the pseudopregnant non-human mammal. The resulting animal is a chimeric animal constructed with both cells having the normal locus of the DNA of the present invention and those having an artificially mutated locus of the DNA of the present invention.

When some germ cells of the chimeric animal have a mutated locus of the  
30 DNA of the present invention, an individual, which entire tissue is composed of cells having a mutated locus of the DNA of the present invention can be selected from a series of offspring obtained by crossing between such a chimeric animal and a normal animal, e.g., by coat color identification, etc. The individuals thus obtained are normally deficient in heterozygous expression of GPR39. The individuals  
35 deficient in homozygous expression of GPR39 can be obtained from offspring of the

intercross between those deficient in heterozygous expression of GPR39.

When an oocyte is used, a DNA solution may be injected, e.g., into the pronucleus by microinjection thereby to obtain a transgenic non-human mammal having a targeting vector introduced in its chromosome. From such transgenic  
 5 non-human mammals, those having a mutation at the locus of the DNA of the present invention can be obtained by selection based on homologous recombination.

As described above, the individuals in which the DNA of the present invention is knocked out permit passage rearing under ordinary rearing conditions, after the individuals obtained by their crossing have proven to have been knockout.

10 Furthermore, the genital system may be obtained and retained by conventional methods. That is, by crossing male and female animals each having the inactivated DNA, homozygous animals having the inactivated DNA in both loci can be obtained. The homozygotes thus obtained may be reared so that one normal animal and two or more homozygotes are produced from a mother animal to  
 15 efficiently obtain such homozygotes. By crossing male and female heterozygotes, homozygotes and heterozygotes having the inactivated DNA are proliferated and passaged.

The non-human mammalian embryonic stem cell, in which the DNA of the present invention is inactivated, is very useful for preparing a non-human mammal  
 20 deficient in expression of the DNA of the present invention.

Moreover, since the non-human mammal deficient in expression of the DNA of the present invention lacks various biological activities induced by GPR39, such an animal can be used as an animal model of diseases suspected of inactivated biological activities of GPR39 and hence, is useful in the etiological studies to  
 25 investigate the causes for and therapy for these diseases.

(12a) Method of screening a compound or its salt having a therapeutic/preventive effect on diseases caused by deficiency, damages, etc. of the DNA of the present invention

30 The non-human mammal deficient in expression of the DNA of the present invention can be employed for screening a compound or its salt having a therapeutic/preventive effect on diseases caused by deficiency, damages, etc. of the DNA of the present invention (e.g., metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability,  
 35 hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis,

myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia,  
 5 hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc.), or a drug for promoting the secretion of cytokines (e.g., IL-8).

That is, the present invention provides a method of screening a compound or its salt having a therapeutic/preventive effect on diseases caused by deficiency,  
 10 damages, etc. of the DNA of the present invention, which comprises administering a test compound or test element to a non-human mammal deficient in expression of the DNA of the present invention and, observing and measuring a change occurred in the animal.

As the non-human mammal deficient in expression of the DNA of the  
 15 present invention, which can be employed for the screening method, the same examples as given hereinabove apply.

Examples of the test compound include peptides, proteins, non-peptide compounds, synthetic compounds, fermentation products, cell extracts, plant extracts, animal tissue extracts, blood plasma, etc. These compounds may be novel  
 20 compounds or publicly known compounds.

As salts of the test compound, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid,  
 25 hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

As the test elements, for example, the elements described in, e.g., the  
 30 Periodic Table, are used. Among them, metal elements are preferred.

Specifically, the non-human mammal deficient in expression of the DNA of the present invention is treated with a test compound or test element, comparison is made with an intact animal for control and a change in each organ, tissue, disease conditions, etc. of the animal is used as an indicator to assess the  
 35 therapeutic/preventive effects of the test compound or test element.

For treating an animal to be tested with a test compound or test element, for example, oral administration, intravenous injection, etc. are applied, and the treatment can be appropriately chosen depending on conditions of the test animal, property of the test compound or test element, etc. Furthermore, a dose of the test compound or test element to be administered can be appropriately chosen depending on the administration methods, properties of the test compound, etc.

When a test compound or test element is administered to a test animal in the screening method and the diseases described above of the test animal are cured by at least about 10%, preferably at least 30%, more preferably at least about 50%, the test compound can be selected to be a compound or its salt having a therapeutic/preventive effect on the diseases described above.

The compound or its salt, which is obtained using the above screening method, is a compound selected from the test compounds described above and can be used as drugs, for example, a safe and low toxic agent for treating/preventing diseases caused by deficiencies, damages, etc. of GPR39 (e.g., metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc.), an agent for promoting the secretion of cytokines (e.g., IL-8), etc. In addition, compounds derived from the compound obtained by the screening described above can be used as well.

As salts of the compound obtained by the screening method, salts with physiologically acceptable acids (e.g., inorganic acids, organic acids, etc.) or bases (e.g., alkali metal salts, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

The pharmaceutical comprising the compound or its salt obtained by the

screening method can be manufactured in the same manner as the aforesaid pharmaceuticals comprising the compound that changes the binding property or signal transduction of GPR39 to the metal element

Since the pharmaceutical preparation thus obtained is safe and low toxic, it can be administered to human or mammal (e.g., rat, mouse, guinea pig, rabbit, sheep, swine, bovine, horse, cat, dog, monkey, etc.).

The dose of the compound or its salt may vary depending upon target disease, subject to be administered, route of administration, etc. For example, when the compound or its salt is orally administered, the compound or its salt is administered to the patient (as 60 kg body weight) with, e.g., cancer generally in a daily dose of about 0.1 to about 100 mg, preferably about 1.0 to about 50 mg and, more preferably about 1.0 to about 20 mg. In parenteral administration, a single dose of the compound or its salt may vary depending upon target subject, target disease, etc. When the compound or its salt is administered to the patient (as 60 kg body weight) with, e.g., cancer in the form of an injectable preparation, the compound or its salt is administered intravenously in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg. For other animal species, the corresponding dose as converted per 60 kg weight can be administered.

(12b) Method of screening a compound or its salt that promotes or inhibits the activity of a promoter for the DNA of the present invention

The present invention provides a method of screening a compound or its salts that promote or inhibit the activity of a promoter for the DNA of the present invention, which comprises administering a test compound to a non-human mammal deficient in expression of the DNA of the present invention and detecting the expression of the reporter gene.

In the screening method described above, an animal in which the DNA of the present invention is inactivated by introducing a reporter gene and the reporter gene is expressed under control of a promoter for the DNA of the present invention is used as the non-human mammal deficient in expression of the DNA of the present invention, which is selected from the aforesaid non-human mammals deficient in expression of the DNA of the present invention.

The same examples of the test compound apply to the compounds used for the screening.

As the reporter gene, the genes as described above may be used. Preferably,  $\beta$ -galactosidase (lacZ), soluble alkaline phosphatase gene, luciferase gene and the like, are suitable for use.

Since the reporter gene is present under control of a promoter for the DNA of the present invention in the non-human mammal deficient in expression of the DNA of the present invention wherein the DNA of the present invention is substituted with the reporter gene, the activity of the promoter can be detected by tracing the expression of a substance encoded by the reporter gene.

When a part of the DNA region encoding GPR39 is substituted with, e.g.,  $\beta$ -galactosidase gene (lacZ) derived from *Escherichia coli*,  $\beta$ -galactosidase is expressed in a tissue where GPR39 should originally be expressed, instead of GPR39. Thus, the expression state of GPR39 can be readily observed in vivo of an animal by staining with a reagent, e.g., 5-bromo-4-chloro-3-indolyl- $\beta$ -galactopyranoside (X-gal) which is substrate for  $\beta$ -galactosidase. Specifically, a mouse deficient in GPR39, or its tissue section is fixed with glutaraldehyde, etc. After washing with phosphate buffered saline (PBS), the system is reacted with a staining solution containing X-gal at room temperature or about 37°C for approximately 30 minutes to an hour. After the  $\beta$ -galactosidase reaction is terminated by washing the tissue preparation with 1 mM EDTA/PBS solution, the color formed is observed. Alternatively, mRNA encoding lacZ may be detected in a conventional manner.

The compound or its salt obtained by using the screening method described above is a compound or its salt that is selected from the test compounds described above and that promotes or inhibits the activity of a promoter for the DNA of the present invention.

As salts of the compound obtained by the screening method, salts with physiologically acceptable acids (e.g., inorganic acids, etc.) or bases (e.g., organic acids, etc.) may be used and preferably used are physiologically acceptable acid addition salts. Examples of such salts are salts with inorganic acids (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid, etc.), salts with organic acids (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid, etc.) and the like.

The compound or its salt that promotes the activity of a promoter for the DNA of the present invention can promote the expression of GPR39 to promote the function of GPR39 and is thus useful as a pharmaceutical such as a

prophylactic/therapeutic agent for, e.g., diseases associated with the dysfunction of GPR39, or as an agent for promoting the secretion of cytokines (e.g., IL-8), etc.

The compound or its salt that inhibits the activity of a promoter for the DNA of the present invention can inhibit the expression of GPR39 to inhibit the function of GPR39 and is thus useful as a pharmaceutical such as a prophylactic/therapeutic agent for, e.g., diseases caused by the excessive function of GPR39, or as an agent for suppressing the secretion of cytokines (e.g., IL-8), etc.

The diseases associated with the dysfunction of GPR39 include metal deficiency symptoms such as growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances, indigestion, cardiac disturbances, gray hair, puffiness, wrinkles, saggings, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc.

The diseases caused by the excessive function of GPR39 include, for example, excess metal-induced symptoms such as renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, various disorders caused by urinary calculus, etc., or inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis or chronic obstructive pulmonary disease (COPD)), etc.

In addition, compounds derived from the compound obtained by the screening described above can be used as well.

The pharmaceutical comprising the compound or its salt, which is obtained by the screening method above, can be manufactured in a manner similar to the method for manufacturing the pharmaceutical comprising the compound or its salt that changes the binding property of GPR39 or its salt to the metal element described above.

Since the pharmaceutical preparation thus obtained is safe and low toxic, it can be administered to, for example, human or mammal (e.g., rat, mouse, guinea pig, rabbit, sheep, swine, bovine, horse, cat, dog, monkey, etc.).

The dose of the compound or its salt may vary depending upon target  
5 disease, subject to be administered, route of administration, etc. For example, when the compound or its salt that promotes the activity of a promoter for the DNA of the present invention is orally administered, the compound or its salt is generally administered to the patient (as 60 kg body weight) with, e.g., cancer in a daily dose of about 0.1 to about 100 mg, preferably about 1.0 to about 50 mg and, more  
10 preferably about 1.0 to about 20 mg. In parenteral administration, a single dose of the compound or its salt may vary depending upon target subject, target disease, etc. When the compound or its salt that promotes the activity of a promoter for the DNA of the present invention is administered to the patient (as 60 kg body weight) with, e.g., cancer in the form of an injectable preparation, the compound or its salt is  
15 advantageously administered intravenously in a daily dose of about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, and more preferably about 0.1 to about 10 mg. For other animal species, the corresponding dose as converted per 60 kg weight can be administered.

As stated above, the non-human mammal deficient in expression of the  
20 DNA of the present invention is extremely useful for screening the compound or its salt that promotes or inhibits the activity of a promoter for the DNA of the present invention and can greatly contribute to elucidation of causes for various diseases suspected of deficiency in expression of the DNA of the present invention and for the development of preventive/therapeutic drugs for these diseases.

Also, a so-called transgenic animal (gene transferred animal) can be  
25 prepared by using a DNA containing the promoter region of GPR39, ligating genes encoding various proteins at the downstream and injecting the same into oocyte of an animal. It is thus possible to synthesize GPR39 therein specifically and study its activity in vivo. When an appropriate reporter gene is ligated to the promoter site  
30 described above and a cell line that expresses the gene is established, the resulting system can be utilized as the search system for a low molecular compound having the action of specifically promoting or inhibiting the in vivo productivity of GPR39 itself.

When bases, amino acids, etc. are represented by abbreviation in the present  
35 specification and drawings, abbreviations are based on those according to

IUPAC-IUB Commission on Biochemical Nomenclature or by the conventional abbreviations in the art, examples of which are shown below. For amino acids, which may have an optical isomer, L form is presented unless otherwise indicated.

5	DNA	: deoxyribonucleic acid
	cDNA	: complementary deoxyribonucleic acid
	A	: adenine
	T	: thymine
	G	: guanine
10	C	: cytosine
	RNA	: ribonucleic acid
	mRNA	: messenger ribonucleic acid

	Bum	: t-butoxymethyl
	Fmoc	: N-9-fluorenylmethoxycarbonyl
	HOBt	: 1-hydroxybenzotriazole
	HOObt	: 3,4-dihydro-3-hydroxy-4-oxo-1,2,3-benzotriazine
30	HONB	: 1-hydroxy-5-norbornene-2,3-dicarboxyimide
	DCC	: N,N'-dicyclohexylcarbodiimide

The sequence identification numbers in the sequence listing of the specification indicates the following sequence, respectively.

35 SEQ ID NO: 1

This shows the amino acid sequence of human-derived GPR39.

SEQ ID NO: 2

This shows the base sequence of cDNA encoding human-derived GPR39.

SEQ ID NO: 3

5        This shows the base sequence of the primer used for TaqMan PCR in  
EXAMPLE 3 below.

SEQ ID NO: 4

This shows the base sequence of the primer used for TaqMan PCR in  
EXAMPLE 3 below.

10      SEQ ID NO: 5

This shows the base sequence of the probe used for TaqMan PCR in  
EXAMPLE 3 below.

SEQ ID NO: 6

This shows the amino acid sequence of mouse-derived GPR39.

15      SEQ ID NO: 7

This shows the base sequence of cDNA encoding mouse-derived GPR39.

SEQ ID NO: 8

This shows the amino acid sequence of rat-derived GPR39.

SEQ ID NO: 9

20        This shows the base sequence of cDNA encoding rat-derived GPR39.

SEQ ID NO: 10

This shows the base sequence of the primer used for TaqMan PCR in  
EXAMPLE 7 below.

SEQ ID NO: 11

25        This shows the base sequence of the primer used for TaqMan PCR in  
EXAMPLE 7 below.

SEQ ID NO: 12

This shows the base sequence of the probe used for TaqMan PCR in  
EXAMPLE 7 below.

30      SEQ ID NO: 13

This shows the base sequence of the primer used for TaqMan PCR in  
EXAMPLE 9 below.

SEQ ID NO: 14

35        This shows the base sequence of the primer used for TaqMan PCR in  
EXAMPLE 9 below.

SEQ ID NO: 15

This shows the base sequence of the probe used for TaqMan PCR in  
EXAMPLE 9 below.

## 5   EXAMPLES

Hereinafter the present invention will be described in detail with reference  
to EXAMPLES but the scope of the present invention is not deemed to be limited  
thereto. Gene using *Escherichia coli* was performed in accordance with the method  
described in Molecular cloning.

10

### EXAMPLE 1

Acquisition of human GPR39-GFP fusion protein-expressing CHO cells

An expression plasmid was constructed to express a fusion protein of Green  
Fluorescent Protein (GFP) cDNA isolated from jelly fish *Aequorea victoria*, fused to  
15 human GPR39 at the C terminus, so as to match the translation frame. In this case, a  
fragment excised from the expression vector pQBI25 (Takara Shuzo) for GFP was  
used as GFP cDNA. In the GPR39, its termination codon was corrected by PCR to  
the recognition sequence with restriction enzyme *NheI*, and the GFP fragment was  
ligated thereto, which was inserted into the expression vector pAKKO-111H (the  
20 same plasmid vector as pAKKO-1.11H described in *Biochem. Biophys. Acta*,  
Hinuma, S. et al., 1219, 251-259, 1994). Using this vector, the GPR39-GFP fusion  
protein-expressing CHO cells were acquired.

### EXAMPLE 2

25   Detection of the agonist activity of metal elements for GPR39

Agonists for GPR39 were surveyed by the method described below and as a  
result, it was found that particular metal elements were agonists for GPR39.

The human GPR39-GFP expression vector-transfected CHO cell line  
produced in EXAMPLE 1 (CHO/hGPR39-GFP) was diluted in  $3 \times 10^4$  cells/100  $\mu$ l.  
30 The dilution was dispensed onto a Black walled 96-well plate (Costar) in 100  $\mu$ l each  
per well, followed by incubation overnight in a CO<sub>2</sub> incubator. Changes in  
intracellular calcium levels were determined by the following method using FLIPR  
(Molecular Device). In 21  $\mu$ l of DMSO (DOJIN), 50  $\mu$ g of Fluo-3AM (DOJIN) was  
dissolved and an equal volume of 20% Pluronic acid (Molecular Probes) was added  
35 to the solution. After mixing them, the resulting mixture was added to 10.6 ml of

assay buffer [prepared by adding 20 ml of 1M HEPES (pH 7.4) (DOJIN) to HBSS (Invitrogen Corp.) and further adding to the solution 10 ml of a solution mixture, which mixture was prepared by dissolving 710 mg of Probenecid (Sigma) in 5 ml of 1N NaOH and then adding thereto 5 ml of the HBSS/HEPES solution above]

5 supplemented with 105  $\mu$ l of fetal calf serum to prepare a fluorescent dye solution. The medium in the cell plate was removed. Immediately thereafter, the fluorescent dye solution was dispensed in 100  $\mu$ l each/well and the cells were incubated in a CO<sub>2</sub> incubator for an hour so that the fluorescent dye was taken up into the cells. The cells after the incubation were washed with the assay buffer described above and set on

10 FLIPR. Compounds of metal elements to be added to the cells were diluted to the respective concentration with the assay buffer. The dilutions were dispensed onto plates for ligands and set on FLIPR. Following the pre-treatment above, changes in intracellular calcium levels after addition of metal elements were determined by FLIPR to study agonist activities. The results indicate that the intracellular calcium

15 levels of CHO/hGPR39-GFP were dose-dependently increased when cadmium chloride (CdCl<sub>2</sub>), zinc chloride (ZnCl<sub>2</sub>), copper chloride (CuCl<sub>2</sub>) and nickel chloride (NiCl<sub>2</sub>) were added (FIGS. 1 through 4). In the CHO cells where the receptor was not expressed or in the CHO cells where GPCR other than GPR39 was expressed, no such response was observed. Accordingly, it was found that these metal salts (metal

20 ions) were the agonists specific to GPR39.

### EXAMPLE 3

#### Expression of human GPR39 mRNA

The expression level of mRNA was assayed on ABI PRISM 7900HT

25 SequenceDetector (Applied Biosystems, Inc.). Primers [5'-TGTGACATTGGCCGTATGCT-3' (SEQ ID NO: 3) and 5'-CAGTCGTGCTTGGGTTTGG-3' (SEQ ID NO: 4)] and probe [5'-TGCCCAACCAGATTCGGAGGATCA-3' (SEQ ID NO: 5)] used for quantification of the expression level were designed based on the base sequence of

30 human GPR39 (SEQ ID NO: 2) using software PrimerExpress (Applied Biosystems, Inc.) exclusively used for ABI PRISM SequenceDetector. As the cDNA to be used as a template, cDNA synthesized from 1  $\mu$ g of total RNA derived from various human tissues and cells by reverse transcription using random primers. Reverse transcription was carried out according to the protocol attached, using SuperScriptII (GIBCO

35 BRL) as reverse transcriptase. A reaction solution for ABI PRISM 7900HT

SequenceDetector was prepared by mixing 7.5 µl of TaqMan Universal PCR Master Mix (Applied Biosystems, Inc.), 0.9 µM of each primer, 0.25 µM of the probe and the cDNA solution. Distilled water was added to the mixture to make the volume 15 µl. The reaction was carried out at 50°C for 2 minutes and 95°C for 10 minutes and then repeating 40 times the cycle of 96°C for 15 seconds and 60°C for 1 minute.

The expression of mRNA in various human tissues and cells is shown in FIG. 5 through FIG. 7. The mRNA was highly expressed in central nervous tissues, hypophysis, kidney, gastrointestinal tract tissues, fetal brain, primary cultured cells from the vascular system, primary cultured cells from the renal system, or colon cancer cell lines.

#### REFERENCE EXAMPLE 1

Acquisition of human GPR39, rat GPR39 and mouse GPR39-expressing cells

The cDNAs of human GPR39, rat GPR39 and mouse GPR39 were acquired from cDNAs including the intestinal tract by RT-PCR, based on known sequences of AF034633.1 (human), XM\_222578 (rat), AK016817 and AK082941.1 (mouse), respectively. The resulting DNA fragments were inserted into expression vector pAKKO-111H (the same plasmid vector as pAKKO-1.11H described in Biochem. Biophys. Acta, Hinuma, S. et al., 1219, 251-259, 1994) for animal cells. Using this vector, the GPR39-expressing CHO cells were acquired by the method per se known.

#### EXAMPLE 4

Detection of signal with Cytosensor

Activation of the intracellular signal transduction system by ligands using a Cytosensor was determined in terms of the pH changes by metabolism of cells as an indicator.

The procedures were as follows. On the previous day, the human GPR39-expressing CHO cell line was cultured in a culture flask to reach a confluent state. After washing with PBS (Invitrogen Corp.), the cells were scraped off using trypsin (Invitrogen Corp.) and centrifuged for recovery. The cells were then suspended in medium and the suspension was adjusted to  $3 \times 10^5$  cells/ml. The capsule of Cytosensor capsule kit (Molecular Device) was placed on a 12-well plate (Costar) and 1 ml of the cell suspension was charged therein. After covering with the lid, the cells were incubated at 37°C in an incubator until next day. On the day when the assay was conducted, Cytosensor was activated as instructed by the protocol.

Then, RPMI1640 medium (pH 7.4) (Invitrogen Corp.) for Cytosensor was prepared and equilibrated. The spacer was then placed in the capsule where the cells prepared on the previous day were seeded, and the capsule was set on Cytosensor. After equilibration with the medium, a sample was added to the cells by switching the flow path and pH changes were determined.

The results indicate that when nickel chloride was added, any response was not detected in mock cells where GPR39 was not expressed and in other receptor TGR7, whereas in the GPR39-expressed cells, a cell response specific to nickel was detected (FIG. 8).

## EXAMPLE 5

### Detection of the agonist activity of metal elements for rat GPR39

Using the CHO cell line where rat GPR39 was stably expressed, the agonist activity of metal ions was detected using FLIPR in terms of the intracellular calcium-increasing reaction as an indicator. The CHO cell line used, wherein rat GPR39 was stably expressed, was cultured in HAM's  $\alpha$ MEM (Invitrogen Corp.) containing 10% calf fetal serum (Invitrogen Corp.). On the day before the assay was conducted, the human GPR39-expressing CHO cell line was cultured in a culture flask to reach a confluent state. After washing with PBS, the cells were scraped off using trypsin and centrifuged for recovery. The cells were then suspended in medium and the suspension was adjusted to  $3 \times 10^5$  cells/ml. Then, the suspension was dispensed onto a black walled 96-well plate (Costar) in 100  $\mu$ l each per well, followed by incubation overnight in a CO<sub>2</sub> incubator.

On the day when the assay was conducted, various test samples were added to the cells and the changes of intracellular calcium levels in this case were determined by FLIPR (Molecular Device). In order to determine the changes in intracellular calcium levels on FLIPR, the cells were pre-treated by the following procedures. First, for the purpose of adding a fluorescent dye Fluo-3AM (DOJIN) to the cells or washing the cells immediately before the FLIPR assay, an assay buffer was prepared. A solution was prepared by adding 20 ml of 1M HEPES (pH 7.4) (DOJIN) to 1000 ml of HBSS (Invitrogen Corp.) (hereinafter HBSS/HEPES solution), to which solution was added 10 ml of a solution mixture obtained by dissolving 710 mg of Probenecid (Sigma) in 5 ml of 1N NaOH and further adding 5 ml of HBSS/HEPES solution thereto. The resulting solution was used as the assay buffer. Next, 50  $\mu$ g of Fluo-3AM was dissolved in 21  $\mu$ l of DMSO (DOJIN) and an

equal volume of 20% Pluronic acid (Molecular Probes) was added to and mixed with the solution. The mixture was then added to 10.6 ml of the assay buffer supplemented with 105  $\mu$ l of fetal calf serum to prepare a fluorescent dye solution. The medium for the CHO cells where human GPR39 was stably expressed was removed. Immediately thereafter, the fluorescent dye solution was dispensed in 100  $\mu$ l each/well and the cells were incubated in a CO<sub>2</sub> incubator for an hour so that the fluorescent dye was taken up into the cells. The cells after the incubation was washed with the assay buffer described above and set on FLIPR. A test sample to be added to the CHO cells where rat GPR39 was stably expressed was prepared using the assay buffer and set on FLIPR at the same time. Following the pre-treatment above, the changes in intracellular calcium levels after the addition of each test sample were determined by FLIPR. The results indicate that, when cobalt chloride (CoCl<sub>2</sub>), nickel chloride (NiCl<sub>2</sub>), copper chloride (CuCl<sub>2</sub>), zinc chloride (ZnCl<sub>2</sub>) or cadmium chloride (CdCl<sub>2</sub>) was added, the intracellular calcium levels of CHO/rGPR39 was dose-dependently increased and the agonist activity for GPR39 was detected (FIG. 9 through FIG. 13).

#### EXAMPLE 6

Detection of the agonist activity of metal elements for mouse GPR39

Using the CHO cell line where mouse GPR39 was stably expressed, the agonist activity of metal ions was detected on FLIPR in accordance with the procedures described in EXAMPLE 5, in terms of the intracellular calcium-increasing reaction as an indicator. The results indicate that, when cobalt chloride (CoCl<sub>2</sub>), nickel chloride (NiCl<sub>2</sub>), copper chloride (CuCl<sub>2</sub>), zinc chloride (ZnCl<sub>2</sub>) or cadmium chloride (CdCl<sub>2</sub>) was added, the intracellular calcium levels of CHO/mGPR39 was dose-dependently increased and the agonist activity for GPR39 was detected (FIG. 14 through FIG. 18).

#### EXAMPLE 7

Analysis of the tissue distribution of GPR39 mRNA in rats by RT-PCR

Various organs were removed from Wistar rats and the total RNA was prepared using Isogen (Nippon Gene Co., Ltd.) in accordance with its manual. Using a random primer and SuperScriptII reverse transcriptase (GIBCO BRL) as a reverse transcriptase, cDNA was synthesized from 1  $\mu$ l of the total RNA obtained, according to the manual. The cDNA synthesized was made a solution of 25 ng/ $\mu$ l when

calculated as total RNA and the solution was used as a template for the following RT-PCR. In RT-PCR, Sequence Detection System Prism 7900 (PE Biosystems) was used; as primers for amplification and detection,

5'-CCCATGGAGTTCTACAGCATCAT-3' (SEQ ID NO: 10) and

5'-TGTGGAGCTTGCAGGACAGA-3' (SEQ ID NO: 11) were used and  
5'-(Fam)-TGGAACCCCCTGACCACACCCA-(Tamra)-3' (SEQ ID NO: 12) as a TaqMan probe. A solution for RT-PCR was prepared by adding 0.135  $\mu$ l each of the primer solutions each adjusted to 100  $\mu$ M, 0.75  $\mu$ l of the TaqMan probe adjusted to 5  $\mu$ M and 1  $\mu$ l of the cDNA solution prepared above to 7.5  $\mu$ l of TaqMan Universal PCR Master Mix (PE Biosystems) and then adding distilled water to make the whole volume of the reaction solution 15  $\mu$ l. PCR was carried out, after keeping at 50°C for 2 minutes and 95°C for 10 minutes, by repeating 40 times the cycle of 95°C for 15 seconds and 60°C for 1 minute. The expression levels of GPR39 mRNA in various rat tissues obtained were calculated as the number of copies per 25 ng of total RNA (FIG. 19).

#### EXAMPLE 8

Analysis of the expression distribution of GPR39 mRNA in bladder by in situ hybridization

Male Wistar rats were sacrificed and the bladder was taken out. After rinsing with PBS, the bladder was embedded in OCT Compound and frozen in liquid nitrogen, which was stored at -80°C.

GPR39 antisense and sense probes were prepared by the following procedures. First, rat GPR39 cDNA was inserted into plasmid vector pCRII TOPO (Invitrogen Corp.) by the method per se known. This cDNA was amplified by PCR using M13 primer (Invitrogen Corp.)/Advantage 2 PCR kit (Clontech Corp.), denatured and then purified by ethanol precipitation. The cDNA was subjected to in vitro transcription (40  $\mu$ l scale) by SP6 or T7 using DIG RNA Labeling KIT (SP6/T7) (Roche). After purification by ethanol precipitation, the cDNA was dissolved in distilled water to make the volume 100  $\mu$ l. Based on the inserted direction of cDNA, the DIG-labeled riboprobe produced by SP6 and the DIG-labeled riboprobe produced by T7 were identified to be an antisense probe and a sense probe, respectively.

For in situ hybridization, fresh frozen sections were used. First, the frozen bladder tissue described above was sliced in a thickness of 8  $\mu$ m on a silane-coated

slide using Cryostat CM3050 (Leica). The slice was fixed in 4% paraformaldehyde-containing PBS for 10 minutes, then thoroughly washed with PBS and acetylated by treating (room temperature, 10 minutes) with 0.1M triethanolamine (pH 8.0) containing 0.25% acetic anhydride. For hybridization, the antisense probe or sense probe was diluted to 200-fold with a hybridization buffer (50% formaldehyde, 10 mM Tris-HCl, pH 7.5, 1 x Denhardt's solution, 200 µg/ml tRNA, 10% dextran sulfate, 600 mM NaCl, 0.25% SDS, 1 mM EDTA), denatured at 85°C for 10 minutes, and then added to the slice, followed by reacting at 50°C for at least 12 hours. Subsequently, the following procedures were carried out to wash the probe hybridized non-specifically. 1) A treatment with 2 x SSC (SSC; 1 x SSC = 150 mM NaCl, 15 mM sodium citrate, pH 7.0)/50% formamide (60°C for 30 minutes, once), 2) a treatment with 2 x SSC (60°C for 15 minutes, once) and 3) a treatment with 0.1 x SSC (60°C for 15 minutes, twice). Following the procedures above, immunohistochemistry was applied to detect the DIG-labeled probes. First, after washing with DIG-1 (100 mM Tris-HCl, pH 7.5, 150 mM NaCl, 0.1% Tween 20), non-specific reactions were blocked by a treatment (37°C for an hour) with DIG-1 containing 1.5% Blocking reagent (Roche), and DIG-1 (1 : 1000) containing anti-DIG fab-fragment antibody conjugated with alkaline phosphatase (Roche) was reacted at room temperature for an hour. After thoroughly washing with DIG-1, the tissue was rinsed with DIG-3 (100 mM Tris-HCl, pH 9.5, 100 mM NaCl, 50 mM MgCl<sub>2</sub>), followed by color-forming reaction at room temperature in solutions obtained by adding dimethylformamide containing 0.18 mg/ml 5-bromo-4-chloro-3-indolyl-phosphate (BCIP), 70% dimethylformamide containing 0.34 mg/ml 4-nitroblue tetrazolium (NBT) and polyvinyl alcohol in amounts of 0.35 ml, 0.45 ml and 3%, respectively, based on 10 ml of DIG-3. After the color formation was appropriately terminated by washing with running water, the tissue was sealed in PBS containing 90% glycerol and observed with an optical microscope. The results indicate that a positive signal was observed by the GPR39 antisense probe on the transitional epithelium in the bladder. To the contrary, any signal with the sense probe was not detected in any site. In the lamina propria mucosa, muscular layer and vascular endothelial cells, any signal with the antisense probe was not detected. The foregoing results revealed that GPR39 mRNA was expressed specifically on the transitional epithelium in the bladder.

## 35 EXAMPLE 9

### Selection of GPR39-expressed cell lines

The cell lines used were purchased from Dainippon Pharmaceutical and incubation procedures were performed according to the protocol attached. 5637 (derived from human) was incubated in RPMI 1640 (Invitrogen Corp.) supplemented with 10% FCS to reach a pre-confluent state. HT-1197 (derived from human) and HT-1376 (derived from human) were incubated in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10% FCS and MEM NON-ESSENTIAL AMINO ACIDS to reach a pre-confluent state. UM-UC-3 (derived from human) and NBT-II (derived from rat) were incubated in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10%FCS, 1%MEM NON-ESSENTIAL AMINO ACIDS and 1 mM Sodium pyruvate to reach a pre-confluent state. T24 (derived from human) and MBT-2 (derived from mouse) were incubated in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10% FCS to reach a pre-confluent state. After washing with PBS, the incubated cells were scraped off in PBS/EDTA, centrifuged for recovery and stored at -80°C. Extraction of RNA and synthesis of cDNA were performed according to the manual of ISOGEN (Nippon Gene). The total RNA was thus extracted and purified. From 1 µg of the extracted RNA, first strand cDNA was synthesized using random in accordance with the manual for SuperScript II (Invitrogen Corp.), precipitated in ethanol and dissolved in 10 µl of TE. TaqMan quantification was performed on the cell line-derived cDNA (corresponding to 25 ng RNA), using amplification reagent TaqMan (trademark), Universal PCR Master Mix (Applied Biosystems JAPAN Ltd.) and TaqMan (trademark) primer-probe set for GPR39 detection. The primer-probe set described in EXAMPLE 3 was used for human-derived samples. The primer-probe set described in EXAMPLE 7 was used for rat-derived samples. For mouse-derived samples,

5'-GTACCCACTCACAAGGGACTCAAC-3' (SEQ ID NO: 13) and 5'-TATTGGAGTTTCCAGGTTCATCGT-3' (SEQ ID NO: 14) were used as primers and 5'-(Fam)-CAACCTCTCTCGCACCCGCCA-(Tamra)-3' (SEQ ID NO: 15) was used as a TaqMan probe. The reaction was carried out in 15 µl in total of the reaction solution. The final concentrations of the respective primers and probes were in accordance with the manual.

TaqMan (trademark) PCR was carried out on ABI PRISM (trademark) 7900HT sequence detection system (Applied Biosystems JAPAN Ltd.). The

temperature cycle used was complied with the manual of TaqMan (trademark) Universal PCR Master Mix (Applied Biosystems JAPAN Ltd.).

Quantitative TaqMan analysis of the amplification product was performed using 7900HT SDS software (Applied Biosystems JAPAN Ltd.). The calibration curve used to count the copy number was prepared from  $C_T$  values in six logarithms from  $10^7$  copies/well to  $10^2$  copies/well using the cDNA fragment (human GPR39) or plasmid DNA (mouse GPR39) of known concentrations, including the full length amplification region.

The results indicate that the expression of GPR39 was noted in all cell lines of 5637, HT-1197, HT-1376, UM-UC-3, NBT-II, T24 and MBT-2 (FIG. 20).

#### EXAMPLE 10

Confirmation of the reactivity with metal ions in the human bladder cancer cell lines

The cell lines used were purchased from Dainippon Pharmaceutical and incubation procedures were performed according to the protocol attached. 5637 was incubated in RPMI 1640 (Invitrogen Corp.) supplemented with 10% FCS to reach a pre-confluent state. HT-1197 and HT-1376 were incubated in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10% FCS and MEM NON-ESSENTIAL AMINO ACIDS to reach a pre-confluent state. UM-UC-3 and NBT-II were incubated in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10%FCS and MEM NON-ESSENTIAL AMINO ACIDS to reach a pre-confluent state. T24 and MBT-2 were incubated in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10% FCS to reach a pre-confluent state. Changes in intracellular calcium levels were determined on FLIPR according to the procedures described in EXAMPLE 5. The results indicate that a reaction with nickel was detected in UM-UC-3 and HT-1197.

#### EXAMPLE 11

Promoted secretion of IL-8 from GPR39-expressed UM-UC-3 cells by metal ions

Using GPR39-expressed UM-UC-3 cells, the effects of adding metal ions as the agonist for GPR39 were examined.

On the previous day of assay, UM-UC-3 was cultured in MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with 10%FCS and MEM NON-ESSENTIAL AMINO ACIDS to reach

a pre-confluent state. After washing with PBS, the cells were scraped off using trypsin and centrifuged for recovery. The cells were then suspended in medium and the suspension was adjusted to  $1.5 \times 10^5$  cells/ml. Next, the suspension was dispensed in a 6-well plate (Falcon) at 5 ml each per well, followed by incubation overnight in a CO<sub>2</sub> incubator.

On the day when the assay was conducted, the medium for the cells prepared on the previous day was removed and the cells were washed with MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with MEM NON-ESSENTIAL AMINO ACIDS. Then, 5 ml each was added to each well, followed by incubation at 37°C in a CO<sub>2</sub> incubator for an hour. Thereafter, 5 ml each of MINIMUM ESSENTIAL MEDIUM (WITH EARLE'S SALTS, WITH L-GLUTAMINE) supplemented with MEM NON-ESSENTIAL AMINO ACIDS, to which various test samples were added, was charged in each well, followed by incubation at 37°C in a CO<sub>2</sub> incubator for 12 hours. After the culture supernatant was recovered, IL-8 contained in the samples was quantified by EIA (Amersham). It was confirmed by the results that the amount of IL-8 accumulated was approximately twice in the presence of 1 mM copper chloride, than in the absence of copper chloride, which revealed that GPR39 promoted the secretion of cytokines such as IL-8, etc., as one of its functions.

## EXAMPLE 12

### Effects of the GPR39 agonist on conscious rats

Female SD rats of 9-10 weeks old were anaesthetized by intramuscular injection with 0.1 ml/100 g of a solution obtained by mixing ketamine (50 mg/mL) and xylazine (20 mg/mL) in 5:1. The bladder was then exposed via a midline incision and a hole was made with a 20-G needle to insert a polyethylene tube (PE-50), which tube was sutured to the bladder with cotton thread. The polyethylene tube cannulated into the bladder was cut at a length of about 1 cm, which was connected to a silicon tube (No. 00) and exposed to the dorsum through the skin. The animals were housed in individual cages until they were used for the experiments.

One day after the surgery, the animal was anesthetized with halothane and placed in Ballman cages under restricted conditions. After a three-way cock was connected to the tube cannulated into the bladder, a saline infusion tube was connected to a cystometry tube (resistance to infusion). An electronic scale was placed under the Ballman cages and the micturition volume was measured at the

same time. When the anesthetic completely worn off, the infusion of saline into the bladder commenced and the bladder pressure and micturition volume were recorded on a personal computer via an A-D converter (MP-100, BIOPAC Systems) and analyzed using a dedicated software (AcqKnowledge, BIOPAC Systems).

Saline was infused into the bladder at the rate of 6 ml/hr and the infusion was continued for 1 or 2 hours until stable micturition was recorded. In order to enhance the permeability of a drug into the bladder, protamine sulfate (10 mg/mL in PBS) was infused into the bladder for an hour (Chuang Y, et. al., 2003, *Urology*, 63, 664-670). Any substantial change in micturition intervals was noted by the protamine infusion when compared to those prior to the infusion. Then, saline was reinfused into the bladder and micturition was recorded at least 2 hours until protamine was completely washed off. At the point of time when micturition intervals became constant, the saline was switched to an aqueous solution of 1 mM cupric chloride ( $\text{CuCl}_2$ ) in saline as the GPR39 agonist, followed by observation for about an hour. Mean micturition intervals during from about 30 minutes to about 60 minutes after starting the infusion of  $\text{CuCl}_2$  were calculated to find a ratio to mean micturition intervals for about 30 minutes before the infusion of  $\text{CuCl}_2$  (% of the pre-value).

When the constant infusion solution was changed from saline to the  $\text{CuCl}_2$  solution, the basal pressure was not affected but micturition intervals were shortened. The ratio was shortened to  $42.2 \pm 6.1\%$  ( $n=4$ ) when the pre-value was made 100%. Accordingly,  $\text{CuCl}_2$  infused into the bladder suggested to induce GPR39-mediated pollakiuria, indicating that GPR39 was involved in the regulation of micturition.

## INDUSTRIAL APPLICABILITY

By using GPR39 and its ligand or an ionizable metal element such as cadmium, zinc, copper, nickel, etc. or a salt thereof, a compound or its salt that changes the binding property of the metal element or a salt thereof to GPR39 can be efficiently screened. In addition, an agonist having a more potent activity can be found by using the screening method of the present invention.

The agonist for GPR39 is useful as a prophylactic/therapeutic agent for metal deficiency symptoms, for example, growth retardation, wounds, burn, cold constitution, declining of learning ability, hypogonadism, dysgeusia, anosmia, prostatic hyperplasia, arteriosclerosis, myocardial infarction, apoplexy, cirrhosis, cholesterol accumulation, lowered resistance to infection, gout, cancer, hard labor, diabetes mellitus, brown spots, anemia, alopecia, respiratory disturbances,

indigestion, cardiac disturbances, gray hair, swelling, wrinkles, sagging, hypothyroidism, depression, menoxenia, hypotonic bladder induced by sensory decrease of the bladder by diabetes mellitus, etc., hypotonic bladder induced by postsurgical bladder anesthesia of the pelvic organs; etc., or an agent for promoting the secretion of cytokines (e.g., IL-8).

The antagonist for GPR39 is useful as a prophylactic/therapeutic agent for excess metal-induced symptoms, for example, renal dysfunction, pulmonary dysfunction, allergic dermatitis, sensory neuropathy, Wilson's disease, overactive bladder-induced pollakiuria, nocturia, cystitis-induced pollakiuria including interstitial cystitis, prostatic hyperplasia induced-pollakiuria, urinary incontinence, urinary urgency, pelvic visceral pain, coital pain, bladder irritation symptoms, excess metal-induced symptoms including various disorders caused by urinary calculus, etc; an agent for suppressing the secretion of cytokines (e.g., IL-8); or a prophylactic/therapeutic agent for inflammatory diseases (e.g., diabetic complications such as neuropathy, large vascular disorders, etc.; inflammatory bowel diseases such as ulcerative colitis, etc.; cystitis; irritable bowel syndrome; neuralgia), allergic diseases (e.g., asthma, atopic dermatitis, chronic obstructive pulmonary disease (COPD)), etc.
